**Microstates and Distributions**

(Refer Slide Time: 00:16)

Last class you have seen that entropy is proportional to the number of microstates. And the reason behind the increase of entropy with time was discussed as that entropy is nothing but options. When you have more options you have more entropy.

So in order to show that, I have shown that movie of water in which you could see that every time instant the number of the configurations of the particles were changing. So therefore at every instance of time new microstates were being generated.

Now there for a very complicated systems like water in a glass the string of numbers constituting their position and momentum can be thought of as a microstate. Let us say if we have one particle, one water molecule then it will have 3 atoms therefore 9 positions and therefore 9 different momentum.

So this 18 number will constitute one microstate. If you change any of these 18 numbers then a new microstate will be generated. So today we are going to talk about much simpler system. And then we will come back to this complicated water systems may be later on.

Water system is also complicated because there are interactions between the water which will also change the possibility of certain microstate being there or not being there.

So in order to understand what is a microstate we will discuss some simpler problems. Before that also we will just, you know remind you that we have also discussed about little bit of probability and we discussed about the and probability, or probability and the combination of them.

We showed you that when the number is large then only the probability values are coming to the, the desired value. For example when we toss a coin it becomes point 5 only when you toss many number of times.

And the distributions of probability mass functions for 2 die throw becomes perfect only when you do very high number, in our case we have shown 10,000 trials, 100,000 trials actually gave a right symmetric distributions at the sum equal to 7.

So today we are going to talk about distributions and microstate. So by distribution what we mean is that, imagine that die throw. So there we could see that there were 11 different possibilities. Sum as 2, 3, 4, 5, 6, 7, 8, 9, 10, 11 and 12.

So there were these 11 possibilities and by distribution it means that out of 10,000 or 100,000 trials each of these possibilities occurred some number of times. And which means that our sum of 2 dice got distributed in these numbers between 2 and 12.

So when you talk about distribution and then each distribution had some possibilities, some probability. So here we talk about much simpler thing. When you talk about cards

(Refer Slide Time: 03:42)

we know

(Refer Slide Time: 03:45)

what distribution is, right.

So typically you know, if you know about playing a card then typically there are games called bridge where there are 52 cards and you distribute 13 to each of them.

And so that is called distribution, right. So let us say there are 4 players, 1, 2, 3, and 4. I distribute 4 cards in 4 players. Make it simpler and let us say there are only 2 players. So I will distribute 1 card, 2 card, another card, another card.

(Refer Slide Time: 04:20)

So I distribute my 4 cards into 2 different people, 2 hands or 2 sets.

Now each hand has some cards. For example here you could see that there is one heart

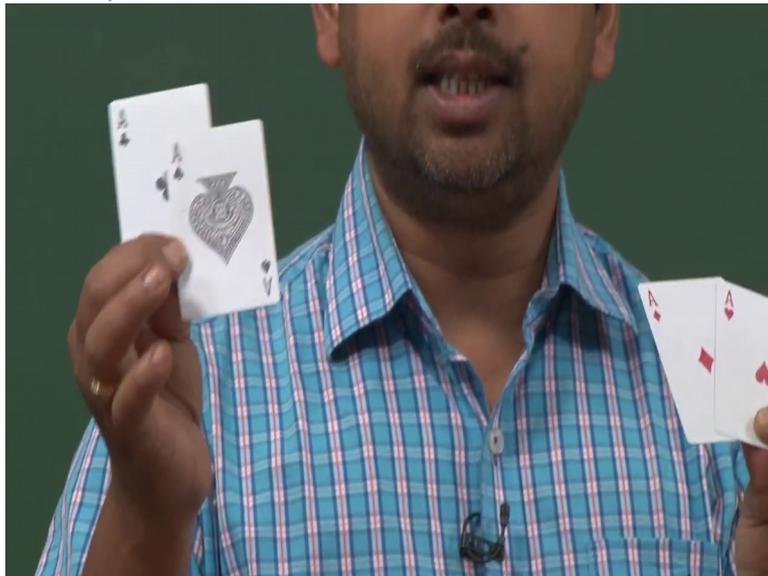

(Refer Slide Time: 04:36)

and one diamond. By the way these all 4 cards are aces. So they are all A as you can see A here, and there are only 4 such cards. One from diamond, one from heart and one from club and one from spade.

They are all distinguishable cards because I know

(Refer Slide Time: 04:53)

aces of heart and aces of club, aces of diamond, aces of spade. I know these 4 cards, distinguishable cards.

But forget about that, they are hearts, spades, clubs and diamonds. Look at their colors. What do you see? In one hand I saw 2 red, in another hand I see 2 black. Now this is just one occurrence of my distribution. I can distribute again. I shuffle it and then let me distribute it again.

What do I see? I see

(Refer Slide Time: 05:32)

1 black and 1 red. And I see in the other hand, of course

(Refer Slide Time: 05:38)

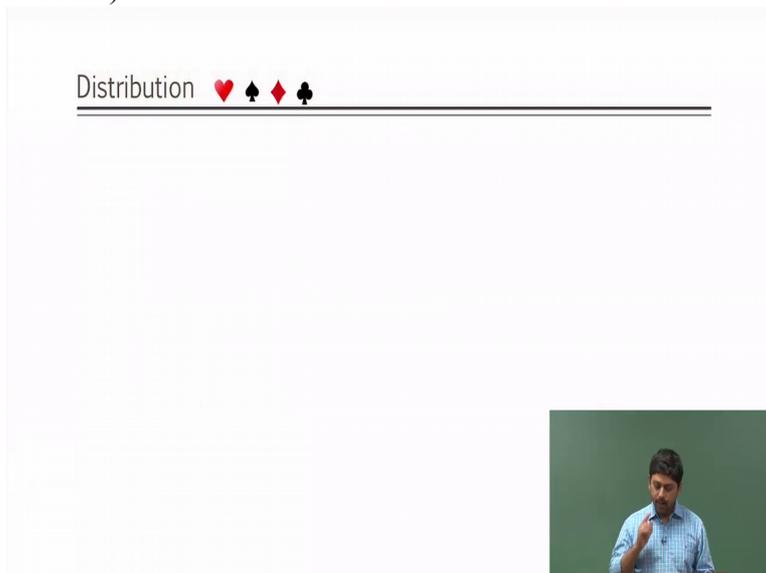

one black and one red. Now what do you think whether this is a better possibility?

Or the other one in which one hand had black card and another hand had red card is the possibility, higher possibility? So which one will be more probable?

So in order to understand that let us see that all possible combinations of these 4 cards distributed among 2 hands.

(Refer Slide Time: 06:09)

So here again as you can see, they are all aces; just think about it that they are all aces. I have not specified that. And now I am going to distribute

(Refer Slide Time: 06:22)

Distribution ♥ ♠ ♦ ♣

	H1	H2
1	♥ ♦	♠ ♣
2	♥ ♠	♦ ♣
3	♥ ♠	♦ ♣
4	♥ ♠	♦ ♣

17	♥ ♠	♦ ♣
18	♥ ♠	♦ ♣
19	♥ ♠	♦ ♣
20	♥ ♠	♦ ♣
21	♥ ♠	♦ ♣
22	♥ ♠	♦ ♣
23	♥ ♠	♦ ♣
24	♥ ♠	♦ ♣

them in the hand 1 and hand 2.

And you can see I distribute heart and diamond to hand 1, and spade and club to hand 2 in one of the distribution, once when I give. And then I can also give heart and diamond and club and spade, another possibility.

And if I go on like that

(Refer Slide Time: 06:51)

Distribution ♥ ♠ ♦ ♣

	H1	H2	H3	H4
1	♥ ♦	♠ ♣		
2	♥ ♠	♦ ♣		
3	♥ ♠	♦ ♣		
4	♥ ♠	♦ ♣		
5	♥ ♠	♦ ♣		
6	♥ ♠	♦ ♣		
7	♥ ♠	♦ ♣		
8	♥ ♠	♦ ♣		
9	♥ ♠	♦ ♣		
10	♥ ♠	♦ ♣		
11	♥ ♠	♦ ♣		
12	♥ ♠	♦ ♣		
13	♥ ♠	♦ ♣		
14	♥ ♠	♦ ♣		
15	♥ ♠	♦ ♣		
16	♥ ♠	♦ ♣		
17	♥ ♠	♦ ♣		
18	♥ ♠	♦ ♣		
19	♥ ♠	♦ ♣		
20	♥ ♠	♦ ♣		
21	♥ ♠	♦ ♣		
22	♥ ♠	♦ ♣		
23	♥ ♠	♦ ♣		
24	♥ ♠	♦ ♣		

then as you can see there are 24 possible distribution of this, you know 4 cards into 2 hands. The reason is that why there is 24 possibilities because they are 4 different cards, hearts, spade, club and diamond.

(Refer Slide Time: 07:09)

Now when you give the first card, first card I can pick any of the 4 possibilities. This first

(Refer Slide Time: 07:16)

card I do not know, I am not looking at it, therefore it can be, I can choose and pick and I can actually take any of the 4.

(Refer Slide Time: 07:24)

Once I take any of the 4, I have then, I am left with 3 more cards.

Second one I can take any of the 3.

(Refer Slide Time: 07:34)

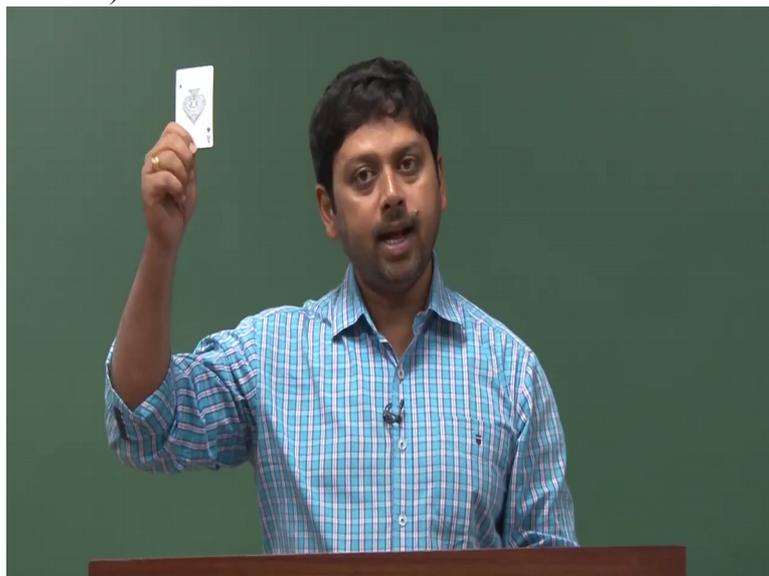

So 4 into 3 is 12. Out of the last 2 cards I can take any of

(Refer Slide Time: 07:40)

the 2, 4 into 3 into 2. And then

(Refer Slide Time: 07:45)

I am left with only one choice, into 1. So the number of possibilities as you can see is  $4 \times 3 \times 2 \times 1$  is equal to 24. And that

(Refer Slide Time: 09:33)

Distribution   $4 \times 3 \times 2 \times 1 = 24$

♦♠	♠♠	♠♦	♥♦
♦♠	♥♠	♠♦	♥♦
♠♠	♥♦	♠♠	♥♥
♠♠	♥♦	♠♠	♥♥

Instead of counting all the possible distribution, let's try to use probability concept

Probability of first card being red =  $2/4$

Probability of the second card being red =  $1/3$

Probability that the second card is red, because there is only 1 more red card left there, right, out of these 3 cards. It should be 1 by 3.

(Refer Slide Time: 13:10)

Distribution ♥ ♠ ♦ ♣

♦♠	♥♠	♠♦	♥♦
♠♠	♥♦	♠♠	♥♥
♠♠	♥♦	♠♠	♥♥

Instead of counting all the possible distribution, let's try to use probability concept

Probability of first card being red =  $2/4$

Probability of the second card being red =  $1/3$

Probability of the third card being black =  $2/2$

Probability that the third card being black, now I have only 2 cards left and I know they are both black, right.

So the probability that the third card is black is 2 by 2 and

(Refer Slide Time: 14:35)

Distribution ♥ ♠ ♦ ♣

H1	H2	H3	H4
♥♦	♠♠	♦♥	♠♠
♥♦	♠♠	♠♥	♦♠
♥♠	♦♦	♠♥	♦♠
♥♠	♦♦	♠♥	♦♠
♦♠	♥♥	♠♦	♥♥
♦♠	♥♥	♠♦	♥♥
♠♠	♥♥	♠♦	♥♥
♠♠	♥♥	♠♦	♥♥
♠♠	♥♥	♠♦	♥♥
♠♠	♥♥	♠♦	♥♥

Instead of counting all the possible distribution, let's try to use probability concept

Probability of first card being red = 2/4

Probability of the second card being red = 1/3

Probability of the third card being black = 2/2

Probability of the fourth card being black = 1/1

$$P_{RRBB} = \frac{2}{4} \times \frac{1}{3} \times \frac{2}{2} \times \frac{1}{1} = \frac{1}{6}$$

$$P_A = P_{RRBB} + P_{BBRR} = \frac{1}{3}$$

and I am getting another possibility. You see here that I am not distinguishing between two hands. I am not saying that hand 1 has to get red and hand 2 has to get black.

That I am not saying here. I am saying any of the hands should get any of the color, but same color. And that is why I need a or probability. And the or probability, as you know adds. And because of that my total probability that one hand gets one color, the other hand gets the other color is 1 by 3.

You see now, without doing, without any (()) (15:12), instead of 4 cards if I had 20 cards, or 20 different colors, should I be enumerating all of them, writing all of them down?

No. I have to use the probability to estimate that what will be the number of possible microstates and what will be the probability of that distribution.

Why I am talking about probability of the distribution? You have to differentiate between distribution and its probability. So we will see later on that there are many possible ways of doing a, performing a distribution.

And in that there is one distribution which will be maximum probable. And you will see that the situation will go towards those probability.

What I mean by that is that if you keep on shuffling the card, you will see more and more mixed color card, one hand is getting mixed color card, that is going towards a more probable situation.

Here there are only 2 possible distribution so that is why you know you go from one to the other not (()) (16:15) so but where there will be many possible distributions and there we will see that one possible distribution will be max.

So now

(Refer Slide Time: 16:23)

Distribution ♥ ♠ ♦ ♣

let us do the P B the same way. First card black, second card, first card red, second card has to be black for the hand 1,

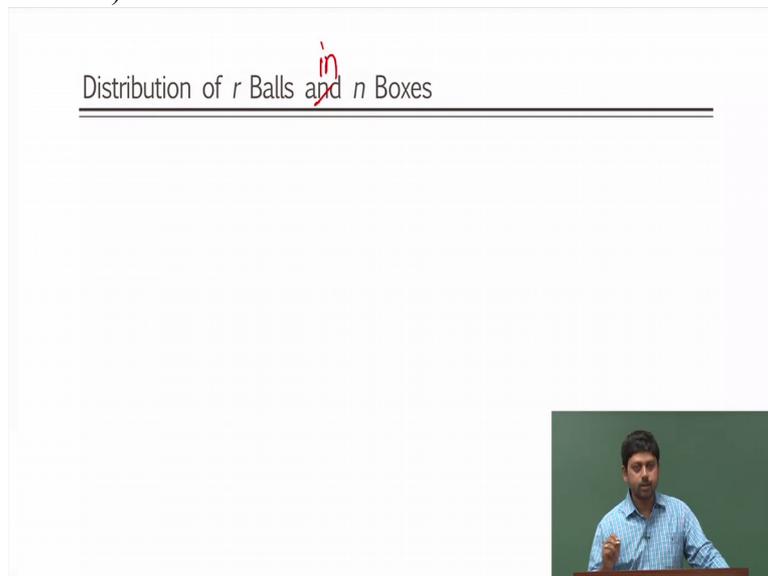

(Refer Slide Time: 18:23)

So now the situation that I talked about, distributing cards in hands, the similar situations or most common probabilistic situations is distribution of  $r$  balls in  $n$  boxes, we can say in  $n$  boxes.

(Refer Slide Time: 18:45)

This is, this particular problem,  $r$  balls in  $n$  boxes is so common that it can be used in many different situations.

It can be mapped or it can be thought of or projected in many, many different situations including that of our current discussions of number of microstates of particles and then chemical systems and things like that.

I will give you some example.

(Refer Slide Time: 19:13)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

So as I said many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes. For example

(Refer Slide Time: 19:23)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes

we talked about dice throw, right. Dice is what; there are all 6 possibilities, right for one particular dice.

When I throw the second die, what you say, again 6 possibilities, right? So you can think of the possible outcome of throwing  $r$  dice, let us say, is corresponding to placing  $r$  balls in  $n$  equal to 6 boxes.

Why that is a, why we are saying that? For example if you have  $n$  equal to 6 boxes means the boxes are distinguishable. That means if I get 1 by throwing a dice it means I am putting a ball in box number 1.

If I get 5 by throwing a dice I will say that I am putting a ball in box number 5. And my balls are distinguishable because I throw the first dice, I throw the second dice.

So my dices are distinguishable because I have first dice, I have second dice, I have third dice and

(Refer Slide Time: 20:33)

Distribution of  $r$  Balls <sup>in</sup> ~~and~~  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes

the boxes are

(Refer Slide Time: 20:47)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes

denoting, the boxes are denoting what is the outcome of throwing a die?

So in a way you are looking at situations of placing  $r$  distinguishable particles, why distinguishable, because first dice, second dice, third dice we know, in 6 distinguishable boxes. Why distinguishable boxes because outcomes are distinguishable.

So that means if I throw 2 dice for example, so if I throw 2 dice then my  $r$  equal to 2

(Refer Slide Time: 21:21)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes  $r=2$

and  $n$  equal to 6.

(Refer Slide Time: 21:23)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes  
 $r=2$   
 $n=6$

What are the possibilities that I can get?

I can get any of the 6, I can put in any of the 6, any of the 6 boxes, the outcome is 6. Second time also I have the outcome of 6. So when I throw 2 dice

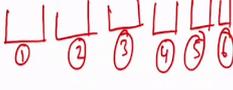

(Refer Slide Time: 21:37)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes  
 $r=2$   
 $n=6$   
 $6 \times 6 = 36$

it is 6 into 6, or 6 to the power 2.

If I throw it 3 times it is this, 6 to the power 3.

(Refer Slide Time: 21:48)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes

$r = 2$   
 $n = 6$

$6 \times 6 = 36$   
 $6 \times 6 \times 6 = 6^3$

If I throw it how many times,  $r$  times, right it will be 6 to the power  $r$ . So in general my formula of placing  $r$  distinguishable ball in  $n$  boxes is  $n$  to the power  $r$ ,

(Refer Slide Time: 22:02)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes

$r = 2$   
 $n = 6$

$6 \times 6 = 36$   
 $6 \times 6 \times 6 = 6^3$   
 $6^r \Rightarrow n^r$

because....I will come back to that more on this.

Another situation

(Refer Slide Time: 22:12)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes
- **Coin toss:** The possible outcome of throwing  $r$  coins correspond to  $r$  balls in  $n=2$  boxes

is that of coin toss. Now can you tell me that how the coin toss can be associated with putting ball in the boxes?

So coin tosses has two outcomes, head or tail. So I can say that 1 box is head, another box is tail. And my first coin is a, you know one ball, my second coin is another ball, my third coin is another ball.

So it is putting  $r$  balls into 2 boxes. So first box, first ball can be in any of the 2 boxes, so 2 possibilities. Second ball can be in any of the two boxes so 2 possibilities. So like that if I have  $r$  balls it will be 2 to the power  $r$  possibilities.

(Refer Slide Time: 22:49)

Distribution of  $r$  Balls <sup>in</sup> and  $n$  Boxes

---

Many probability calculations are equivalent to the above description of placing  $r$  balls in  $n$  boxes.

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes
- **Coin toss:** The possible outcome of throwing  $r$  coins correspond to  $r$  balls in  $n=2$  boxes
- **Birthdays:** The possible configurations of birthdays or  $r$  people correspond to the different arrangement of  $r$  balls in  $n=365$  days

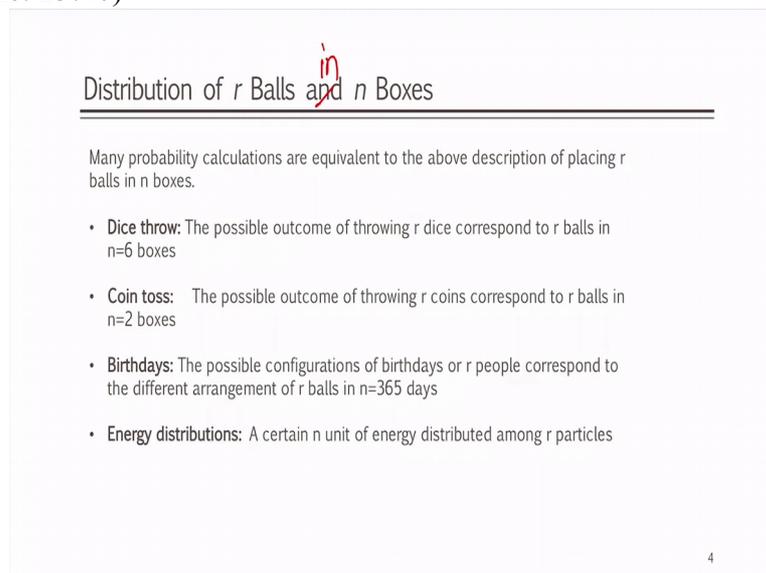

Birthdays, another example that the possible configurations of the birthdays of  $r$  people. So first person can have birthday any of one 365 days. Second person can have birthday any of 365 days. Third person can have, so here  $n$  is 365. So boxes are 365 boxes. You can number them according to the number of the days.

And people are like balls. So you are putting them on the first day on the calendar, this is a calendar. And my birthday is let us say, for example 8 August. So I will be on that day, I will be standing on that day. Somebody else will be standing on some other day.

So you can imagine that birthdays are nothing but putting distinguishing balls like you and me into distinguishable boxes like that particular day of the calendar.

(Refer Slide Time: 23:40)

Distribution of  $r$  Balls <sup>in</sup>  $n$  Boxes

---

- **Dice throw:** The possible outcome of throwing  $r$  dice correspond to  $r$  balls in  $n=6$  boxes
- **Coin toss:** The possible outcome of throwing  $r$  coins correspond to  $r$  balls in  $n=2$  boxes
- **Birthdays:** The possible configurations of birthdays or  $r$  people correspond to the different arrangement of  $r$  balls in  $n=365$  days
- **Energy distributions:** A certain  $n$  unit of energy distributed among  $r$  particles

4

Another example, energy distribution. A certain  $n$  units of energy distributed among  $r$  particles, that is a possibility, right. So you can say that in this case, you know, of course the energies are not distinguishable in some sense but you can say, we are talking about balls and boxes

So we can say that we are putting some, you know definitive energy values, either epsilon, 2 epsilon, 3 epsilon into, you know  $r$  particles.

(Refer Slide Time: 24:10)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 cell

So let us first start with very simple system. So we have seen that by working on the distinguishable, working on this placing balls in boxes we can understand different situations related to creating new microstates including, you know talking about the cards for example we had like 4 cards, right.

We saw that there are 4 cards and there are 4 distinct possibilities, heart, spade, club and diamond. So you can say that there are 4 possibilities and you know in that 4 possibilities if you have multiple number of cards, for example 52 cards then you will actually get placed them accordingly, right, anyway.

So let us start with very simple system. Distribute 1 ball in 1 box,

(Refer Slide Time: 24:58)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 ~~cell~~ box

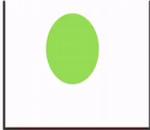

1 ball in 1 box. How can you do that? You have only 1 ball and 1 box.

(Refer Slide Time: 25:03)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 ~~cell~~ box

How many possibilities can you imagine? 1 ball and 1 box, just 1 possibilities.

So I will say number of possibilities we are denoting by  $W$ , remember? We said that  $W$  is number of microstates; we can say number of possibilities as well.

And since microstate is equivalent to entropy then entropy is equivalent to possibilities or options, that is what we discussed, right?

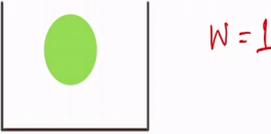

So let us call that as  $W$ . And that

(Refer Slide Time: 25:32)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 ~~cell~~ box

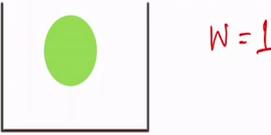

can be only 1. We can no other way. If I have to place it I have to place it, but let us say I have to place it, Ok. I may not choose to place it, that is another possibility.

(Refer Slide Time: 25:44)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 ~~cell~~ box

A. Distribute 2 ball in 1 cell

Distribute 2 balls in 1 box.

(Refer Slide Time: 25:50)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 ~~cell~~ box

$W = 1$

A. Distribute 2 ball in 1 ~~cell~~ box

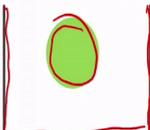

Cell and box are actually the same thing but just specifying box. These are our box, right, these are typical box and this is the ball that we are talking about, Ok.

(Refer Slide Time: 26:01)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 ~~cell~~ box

$W = 1$

A. Distribute 2 ball in 1 ~~cell~~ box

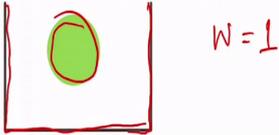

2 balls in 1 box.

(Refer Slide Time: 26:03)

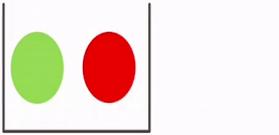

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 cell ~~box~~

A. Distribute 2 ball in 1 cell ~~box~~

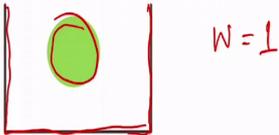

How many ways you can do that? I have to place 2 balls. Only 1. I do not see any other way.

(Refer Slide Time: 26:11)

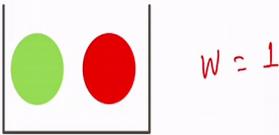

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 cell ~~box~~

A. Distribute 2 ball in 1 cell ~~box~~

So box is important. So you remember I was saying, imagine the, what is the formula we got?

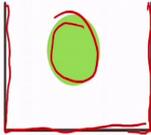

Number of boxes to the power balls, is not it?

(Refer Slide Time: 26:24)

Distribution of balls in Boxes

---

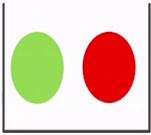

A. Distribute 1 ball in 1 cell box

$W = 1$

balls  
box

A. Distribute 2 ball in 1 cell box

$W = 1$

So in this case it is 1 to the power 1 equal to 1. In this

(Refer Slide Time: 26:28)

Distribution of balls in Boxes

---

A. Distribute 1 ball in 1 cell box

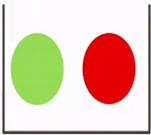

$W = 1$

$1^1 = 1$

balls  
box

A. Distribute 2 ball in 1 cell box

$W = 1$

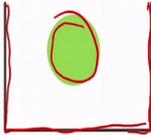

case it is 1 to the power 2 is also 1.

(Refer Slide Time: 26:32)

Distribution of balls in Boxes

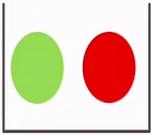

---

A. Distribute 1 ball in 1 cell box

$W = 1 \rightarrow 1^1 = 1$   
balls  
box

A. Distribute 2 ball in 1 cell box

$W = 1 \quad 1^2 = 1$

5

Now let us go to little bit more

(Refer Slide Time: 26:36)

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 cells

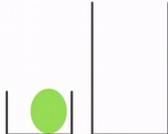

complicated situation. One ball in 2 boxes. I have these

(Refer Slide Time: 26:44)

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 ~~cells~~ *boxes*

The diagram shows two boxes. The left box is shorter and contains one green ball. The right box is taller and is empty.

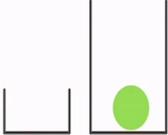

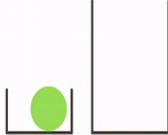

2 box. And I have one ball. I can place it either in the left box or on the right.

(Refer Slide Time: 26:51)

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 ~~cells~~ *boxes*

The diagram shows two boxes. The left box is shorter and contains one green ball. The right box is taller and is empty.

The diagram shows two boxes. The left box is shorter and is empty. The right box is taller and contains one green ball.

I can place it on the left box or on the right box. So I am getting

(Refer Slide Time: 26:56)

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 ~~cells~~ boxes

The diagram illustrates two possible distributions of a single green ball into two boxes. On the left, the ball is in the first box and the second box is empty. On the right, the first box is empty and the ball is in the second box. Between the two diagrams, the handwritten equation  $W=2$  is written in red.

W equal to 2.

So here what is the situation? Box to the power ball, right, box is 2, ball is 1, is equal to 2.

(Refer Slide Time: 27:05)

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 ~~cells~~ boxes

The diagram is identical to the previous slide, showing two boxes with one ball in either the first or second box. Between the diagrams, the handwritten equations  $W=2$  and  $2^1=2$  are written in red.

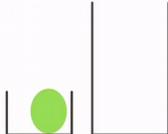

(Refer Slide Time: 27:07)

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 ~~cells~~ *boxes*

$W = 2$   
 $2^1 = 2$

A. Distribute 2 ball in 2 cells

n to the power r is the situation where balls and boxes are both distinguishable. That is why I draw, I drew the boxes are both distinguishable. That is why I draw; I drew the boxes in a distinguishable fashion.

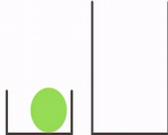

Distribute 2 balls in 2 boxes,

(Refer Slide Time: 27:24)

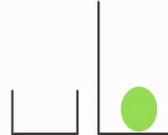

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 ~~cells~~ *boxes*

$W = 2$   
 $2^1 = 2$

A. Distribute 2 ball in 2 ~~cells~~ *boxes*

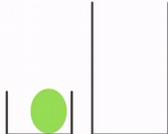

2 balls in 2 boxes. You will see what will be the answer, right? 2 balls, 2 boxes; it should be 4,

(Refer Slide Time: 27:32)

Distribution of balls in boxes

---

A. Distribute 1 ball in 2 cells *boxes*

$W = 2$   
 $2^1 = 2$

A. Distribute 2 balls in 2 cells *boxes*  $2^2 = 4$

is it not? Let us see,

(Refer Slide Time: 27:34)

Distribution of balls in boxes

---

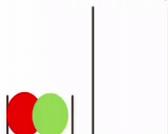

A. Distribute 1 ball in 2 cells *boxes*

$W = 2$   
 $2^1 = 2$

A. Distribute 2 balls in 2 cells *boxes*  $2^2 = 4$

2 ball on the left box,

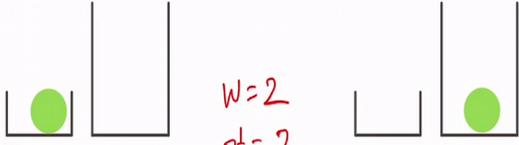

(Refer Slide Time: 27:37)

Distribution of balls in boxes

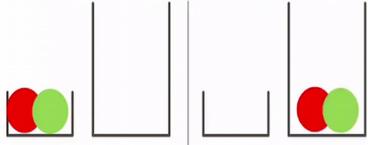

---

A. Distribute 1 ball in 2 cells *boxes*

$W = 2$   
 $2^1 = 2$

A. Distribute 2 balls in 2 cells *boxes*  $2^2 = 4$

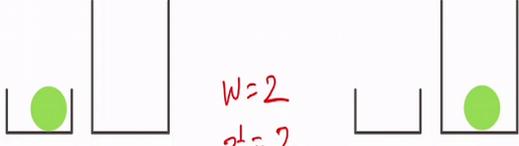

2 ball on the right box,

(Refer Slide Time: 27:38)

Distribution of balls in boxes

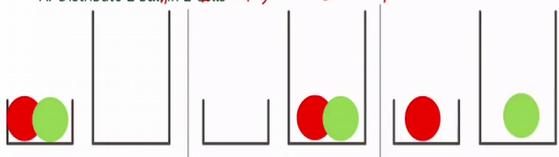

---

A. Distribute 1 ball in 2 cells *boxes*

$W = 2$   
 $2^1 = 2$

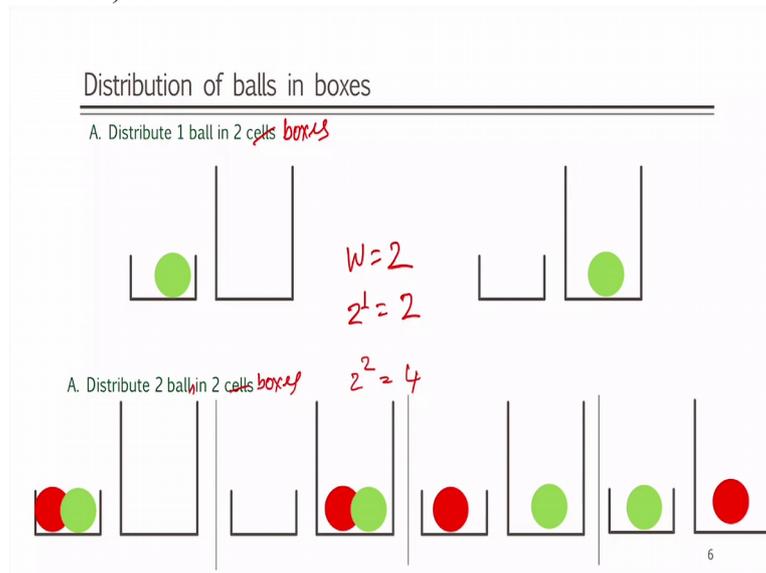

A. Distribute 2 balls in 2 cells *boxes*  $2^2 = 4$

6

2 ball on individual boxes and

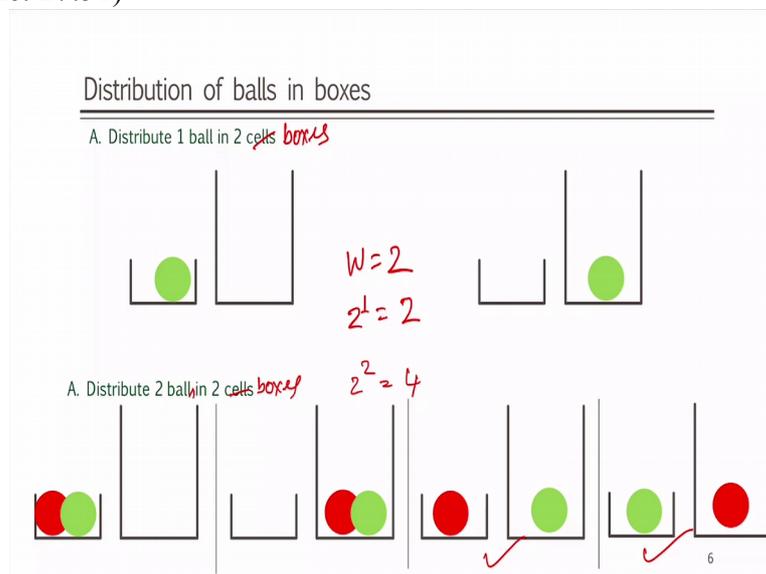

(Refer Slide Time: 27:41)

2 balls again on the individual boxes.

But sort? So you see because my boxes are distinguishable I can distinguish between this and this.

(Refer Slide Time: 27:51)

Otherwise I could not have distinguished. If my boxes were identical then this will mean the same thing.

But here boxes are also distinguishable. And therefore you can see that Ok, my green ball is in a bigger box, and here my green ball is in a smaller box. There must be 2 different configurations, not 1.

So here both the balls and the boxes are distinguishable. Otherwise we will not get all the 4 possibilities.

(Refer Slide Time: 28:22)

### Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

● ● ●

So now we are going to little more complex situations, distribution of 3 distinguishable balls in 3 distinguishable boxes.

(Refer Slide Time: 28:31)

### Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

● ● ●

1.	{abc --- ---}
2.	{--- abc ---}
3.	{-- --- abc}
4.	{ab -c ---}
5.	{a c -b ---}
6.	{ bc --- ---}
7.	{ab --- -c}
8.	{a c --- -b}
9.	{-bc --- a-}

So here are 3 distinguishable balls, we will make it distinguishable, let us make it red. Now we have 3 distinguishable

(Refer Slide Time: 28:46)

Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

balls and I need to put it in 3

(Refer Slide Time: 28:50)

Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1.	{abc --- ---}
2.	{-- abc ---}
3.	{-- --- abc}
4.	{ab --- c}
5.	{a c b ---}
6.	{ bc --- ---}
7.	{ab --- c}
8.	{a c --- b}
9.	{bc --- a}

distinguishable boxes. You know the value, right. It will be  $n$  to the power  $r$ , 3 to the power 3 equal to 27.

Let us see all those 27 possibilities. I can call them also as a, b and c,

(Refer Slide Time: 29:02)

Distribution of balls in boxes

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1.	{abc --- ---}
2.	{--- abc ---}
3.	{-- --- abc}
4.	{ab -c ---}
5.	{a c -b ---}
6.	{ bc --- ---}
7.	{ab --- -c}
8.	{a c --- -b}
9.	{-bc --- a-}

Ok. So here as you can see all a b c are put in the first box. And nothing on the second and third box.

Here all a b c are put in the second box, nothing on the first or third. Here all a b cs are put on the third box, nothing on the first or second.

And like that we get

(Refer Slide Time: 29:23)

Distribution of balls in boxes

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1.	{abc --- ---}	10.	{a- -bc ---}
2.	{--- abc ---}	11.	{-b -a-c ---}
3.	{-- --- abc}	12.	{-c ab - ---}
4.	{ab -c ---}	13.	{a- --- -bc}
5.	{a c -b ---}	14.	{-b -a-c ---}
6.	{ bc --- ---}	15.	{-c --- ab-}
7.	{ab --- -c}	16.	{-- ab - c}
8.	{a c --- -b}	17.	{-- a-c -b}
9.	{-bc --- a-}	18.	{-- -bc a-}

18 and

(Refer Slide Time: 29:25)

Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1.	{abc --- ---}	10.	{a- -bc ---}	19.	{--- a- -bc}
2.	{--- abc ---}	11.	{-b -a-c ---}	20.	{--- -b -a-c}
3.	{-- --- abc}	12.	{-c ab- ---}	21.	{--- -c ab-}
4.	{ab -c ---}	13.	{a- --- -bc}	22.	{a- -b- -c}
5.	{a c -b ---}	14.	{-b -a-c ---}	23.	{a- -c -b-}
6.	{ bc --- ---}	15.	{-c --- ab-}	24.	{-b- a- -c}
7.	{ab --- -c}	16.	{--- ab- -c}	25.	{-b- -c a-}
8.	{a c --- -b-}	17.	{--- a-c -b-}	26.	{-c a- -b-}
9.	{-bc --- a-}	18.	{--- -bc a-}	27.	{-c -b a-}

finally all 27 possibilities. Because I did not have enough, you know space here I could not really draw the boxes and balls and show the configuration.

So this is the short hand notations by which I am showing all possible combinations of putting 3 distinguishable balls in 3 distinguishable boxes. How the boxes are distinguished?

The first one, the first box is, let us say you can call it 1, box number 1, second is box number 2 and third is box number 3.

(Refer Slide Time: 29:54)

Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1.	{abc --- ---}	10.	{a- -bc ---}	19.	{--- a- -bc}
2.	{--- abc ---}	11.	{-b -a-c ---}	20.	{--- -b -a-c}
3.	{-- --- abc}	12.	{-c ab- ---}	21.	{--- -c ab-}
4.	{ab -c ---}	13.	{a- --- -bc}	22.	{a- -b- -c}
5.	{a c -b ---}	14.	{-b -a-c ---}	23.	{a- -c -b-}
6.	{ bc --- ---}	15.	{-c --- ab-}	24.	{-b- a- -c}
7.	{ab --- -c}	16.	{--- ab- -c}	25.	{-b- -c a-}
8.	{a c --- -b-}	17.	{--- a-c -b-}	26.	{-c a- -b-}
9.	{-bc --- a-}	18.	{--- -bc a-}	27.	{-c -b a-}

Once you distinguish the box, then you can automatically get that these should be the possibilities.

And as you see that here also I have number of, n equal to 3 and r equal to 3

(Refer Slide Time: 30:09)

Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1. (abc --- ---)	10. {a- -bc ---}	19. {-- a- -bc}
2. {-- abc ---}	11. {-b -a-c ---}	20. {-- -b -a-c}
3. {-- -- abc}	12. {-c ab ---}	21. {-- --c ab-}
4. {ab -c ---}	13. {a- -- -bc}	22. {a- -b -c}
5. {a c -b ---}	14. {-b -a-c ---}	23. {a- -c -b}
6. { bc --- ---}	15. {-c -- ab-}	24. {-b -a- -c}
7. {ab --- -c}	16. {-- ab ---c}	25. {-b -c a-}
8. {a c --- -b}	17. {-- a-c -b}	26. {-c a- -b}
9. {-bc --- a-}	18. {- -bc a-}	27. {-c -b a-}

a   b   c

$n=3$

$r=3$

and therefore number of possibilities is, as we saw n to the power r or 3 to the power 3 are 27.

(Refer Slide Time: 30:16)

Distribution of balls in boxes

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1. (abc --- ---)	10. {a- -bc ---}	19. {-- a- -bc}
2. {-- abc ---}	11. {-b -a-c ---}	20. {-- -b -a-c}
3. {-- -- abc}	12. {-c ab ---}	21. {-- --c ab-}
4. {ab -c ---}	13. {a- -- -bc}	22. {a- -b -c}
5. {a c -b ---}	14. {-b -a-c ---}	23. {a- -c -b}
6. { bc --- ---}	15. {-c -- ab-}	24. {-b -a- -c}
7. {ab --- -c}	16. {-- ab ---c}	25. {-b -c a-}
8. {a c --- -b}	17. {-- a-c -b}	26. {-c a- -b}
9. {-bc --- a-}	18. {- -bc a-}	27. {-c -b a-}

a   b   c

$n=3$

$r=3$

$W = n^r = 3^3 = 27$

Now think of that as this way.

(Refer Slide Time: 30:21)

### Distribution of balls in boxes

a b c

- Place the first ball in any of the three box. *Take it out.*
- Then place the second ball in any of the three box. *Take it out.*
- Then place the third ball in any of the three box.

❖ Total possibility =  $3^3 = 27$

and place a third ball in any of the boxes and take it out.

So this is called placement with replacement. Because once you placed your first ball, you will be left with only 2 more, right.

But distribution with replacement allows us to have 3 balls back again. So this particular situation of distinguishable balls in distinguishable boxes is placement with replacement. So this is called with replacement.

Distribution of balls in boxes |0| |2| |5|

---

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1. (abc --- ---)	10. {a- -bc ---}	19. {--- a- -bc}
2. {--- abc ---}	11. {-b -a-c ---}	20. {--- -b -a-c}
3. {--- --- abc}	12. {-c ab ---}	21. {--- -c ab-}
4. {ab -c ---}	13. {a- --- -bc}	22. {a- -b -c}
5. {a c -b ---}	14. {-b -a-c ---}	23. {a- -c -b-}
6. {bc --- ---}	15. {-c --- ab-}	24. {-b -a- -c}
7. {ab --- -c}	16. {--- ab ---c}	25. {-b -c a-}
8. {a c --- -b-}	17. {--- a-c -b-}	26. {-c a- -b-}
9. {-bc --- a-}	18. {--- -bc a-}	27. {-c -b -a-}

1 2 3

a b c

- Place the first ball in any of the three box. *Take it out.*
- Then place the second ball in any of the three box. *Take it out.*
- Then place the third ball in any of the three box.

❖ Total possibility =  $3^3 = 27$   
*(with replacement)*

Otherwise if you put a, you do not have a. You have only b and c. But this situations I put a and then take it back again. I still have a b c. Then I can choose any of that. Again I may choose a and put it back. Again I can choose a and put it back.

So this is, this is the situation in which we call that placement with replacement. And there is some situations where we can do without replacement also. We are coming to that.

So therefore if you have r balls in n boxes

(Refer Slide Time: 32:23)

Distribution of balls in boxes | ① | | ② | | ③ |

- Place the first ball in any of the three box. *Take it out.*
- Then place the second ball in any of the three box. *Take it out.*
- Then place the third ball in any of the three box

❖ Total possibility =  $3^3 = 27$   
*(with replacement)*

B. Therefore, if you have r balls and n boxes then

- First ball can be in any of the n boxes: ways = n
- Second ball can be in any of the n boxes: ways = n x n

the second ball can be any of the n boxes so n into n, the third ball

(Refer Slide Time: 32:31)

Distribution of balls in boxes | ① | | ② | | ③ |

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1. (abc --- ---)	10. (a- -bc ---)	19. (--- a- -bc)
2. (--- abc ---)	11. (-b -a-c ---)	20. (--- -b -a-c)
3. (--- --- abc)	12. (-c ab ---)	21. (--- -c ab-)
4. (ab -c ---)	13. (a- ---- -bc)	22. (a- -b -c)
5. (a c -b ---)	14. (-b -a-c ---)	23. (a- -c -b)
6. { bc --- ---)	15. (-c --- ab-)	24. (-b -a -c)
7. (ab --- -c)	16. (--- ab ---c)	25. (-b -c a-)
8. (a c --- -b)	17. (--- a-c -b)	26. (-c a- -b)
9. (-bc --- a-)	18. (--- -bc a-)	27. (-c -b a-)

B. Therefore, if you have r balls and n boxes then

- First ball can be in any of the n boxes: ways = n
- Second ball can be in any of the n boxes: ways = n x n
- Continuing that, the r balls can be placed as = n x n x n ... r terms = n<sup>r</sup>

➤ Place the first ball in any of the three box. *Take it out.*

➤ Then place the second ball in any of the three box. *Take it out.*

➤ Then place the third ball in any of the three box.

❖ Total possibility = = 3<sup>3</sup> = 27  
*(With replacement)*

in any of the n boxes, continuing that I have r balls that can be placed in n into n into n like r times. And it would be n to the power r as we explained before.

(Refer Slide Time: 32:40)

Distribution of balls in boxes | ① | | ② | | ③ |

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1. (abc --- ---)	10. (a- -bc ---)	19. (--- a- -bc)
2. (--- abc ---)	11. (-b -a-c ---)	20. (--- -b -a-c)
3. (--- --- abc)	12. (-c ab ---)	21. (--- -c ab-)
4. (ab -c ---)	13. (a- ---- -bc)	22. (a- -b -c)
5. (a c -b ---)	14. (-b -a-c ---)	23. (a- -c -b)
6. { bc --- ---)	15. (-c --- ab-)	24. (-b -a -c)
7. (ab --- -c)	16. (--- ab ---c)	25. (-b -c a-)
8. (a c --- -b)	17. (--- a-c -b)	26. (-c a- -b)
9. (-bc --- a-)	18. (--- -bc a-)	27. (-c -b a-)

B. Therefore, if you have r balls and n boxes then

- First ball can be in any of the n boxes: ways = n
- Second ball can be in any of the n boxes: ways = n x n
- Continuing that, the r balls can be placed as = n x n x n ... r terms = n<sup>r</sup>

Drawing n distinguishable balls r times with replacement gives the same result.

➤ Place the first ball in any of the three box. *Take it out.*

➤ Then place the second ball in any of the three box. *Take it out.*

➤ Then place the third ball in any of the three box.

❖ Total possibility = = 3<sup>3</sup> = 27  
*(With replacement)*

Now as I said already that drawing n distinguishable balls r times with replacement gives the same result. So let us say you have 3 color balls in a box. Now you want to pick up one of them. There are 3 ways to do that. And you put it back again.

Again you pick up, again 3 ways. You put it back again. Again you pick up. So every time you pick up you have 3 choices. So because you are replacing the ball, right, so it is called replacement distinguishable ball with, picking up r times with replacement.

So this result with replacement is very important.

(Refer Slide Time: 33:19)

Distribution of balls in boxes

2

3

A. Distribution of 3 distinguishable balls in 3 distinguishable boxes

1. {abc --- ---}	10. {a- -bc ---}	19. {--- a- -bc}
2. {--- abc ---}	11. {-b -a-c ---}	20. {--- -b -a-c}
3. {--- --- abc}	12. {-c ab ---}	21. {--- -c ab-}
4. {ab -c ---}	13. {a- - -bc}	22. {a- -b -c}
5. {a c -b ---}	14. {-b -a-c ---}	23. {a- -c -b-}
6. {bc --- ---}	15. {-c --- ab-}	24. {-b -a- -c}
7. {ab --- -c}	16. {--- ab ---c}	25. {-b -c a-}
8. {a c --- -b}	17. {--- a-c -b}	26. {-c a- -b}
9. {-bc --- a-}	18. {- -bc a-}	27. {-c -b a-}

● a    ● b    ● c

- Place the first ball in any of the three box. *Take it out.*
- Then place the second ball in any of the three box. *Take it out.*
- Then place the third ball in any of the three box.

❖ Total possibility =  $3^3 = 27$   
*(with replacement)*

B. Therefore, if you have r balls and n boxes then

- First ball can be in any of the n boxes: ways = n
- Second ball can be in any of the n boxes: ways = n x n
- Continuing that, the r balls can be placed as = n x n x n ... r terms = n<sup>r</sup>

Drawing n distinguishable balls r times with replacement gives the same result.

Because you are replacing the ball back again you are getting the same result, Ok. Now you will see if you do not replace it what will be the situation?

(Refer Slide Time: 33:28)

Permutation (Order)

---

That situation is called permutation.
