Fourier Analysis of Continuous Time Signals and Systems – Introduction

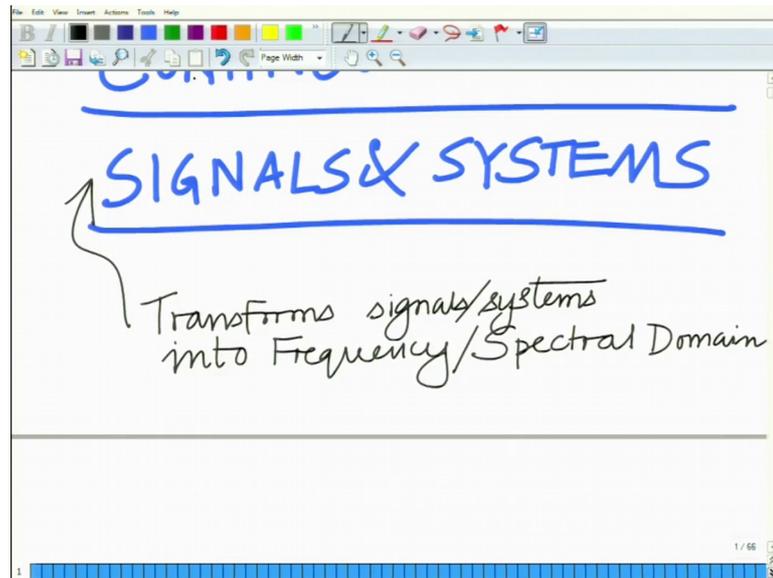

Hello. Welcome to another module in this Massive Open Online Course. So, we are looking at the various properties and principles of signals and systems in this course and we have so far looked at various transforms including the Laplace transform and the z transform meant in this module starting this module let us start looking at yet another transform. In fact, one of the most key I would say a critical transforms, that is used overwhelmingly frequently to understand and analyze the properties and signals and systems, which is the Fourier transform. So, we will start by looking at the Fourier transform for continuous time signals and subsequently also for discrete time signals and systems.

(Refer Slide Time: 00:56)

So, starting this module what we want to look at is we want to look at new transform; we want to look at the Fourier analysis. The Fourier analysis the Fourier transform for first for the continuous time signals and system. So, and remember this is basically its transform now if you look at the Fourier transform.

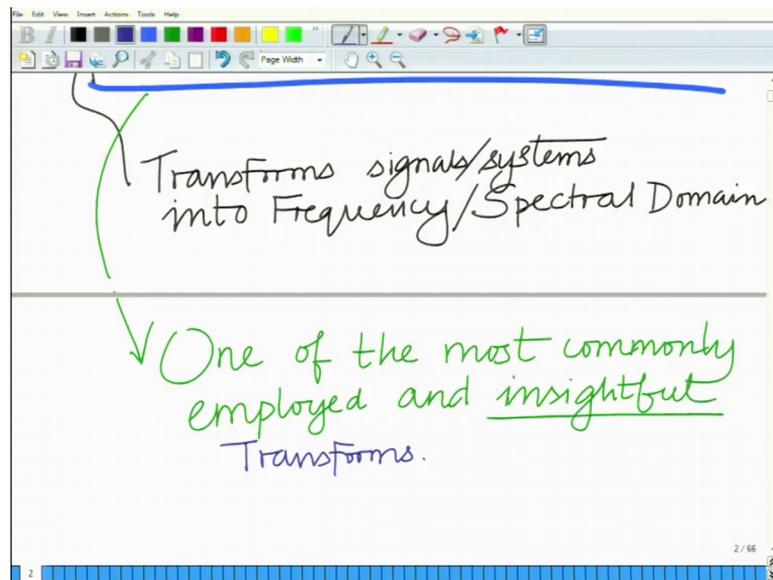

(Refer Slide Time: 01:56)

This is basically the transform it transforms signals or systems transform signals and systems into the frequency or spectral domain, and this is or what is also known as the spectral the frequency spectrum ok.

So, this is transforms the signal or a certain system, which can also be represented as we know a system can also be represented in the transfer in the transform domain through that transfer function alright. So, this Fourier transform basically transforms signals and systems all right into the frequency domain; what is known as the frequency domain in terms of its frequency components or also the spectral domain.

(Refer Slide Time: 02:57)

And the Fourier transform needless to say is one of the most commonly employed and insightful transforms, and one of the most commonly nor and not just in electronics and signal processing.

But in various fields as well various fields of science and engineering its one of the most commonly employed and more importantly not just employed, its one of the most insightful that is the key word here one of the most insightful transforms. Inside by insightful I mean that evaluating the Fourier transform and examining the Fourier transform of a signal or a system, yields immediately yields valuable insights which are not possible otherwise for instance by evaluating the transfer function the Fourier transform of a system you can determine, if the signal is a high pass system or a low pass system or a band pass system similarly for a signal, you can see if it is a high frequency signal low frequency signal of or if it contains frequencies in a certain band.

So, it is one of the most convenient and one of the most insightful transforms and it is overwhelmingly and widely employed in across several fields of science and engineering it is one of the most insightful transforms. And the basis for the Fourier transform is the very simple function consider the complex

(Refer Slide Time: 04:32)

employed and insightful
Transforms.

Consider the complex Exponential

$e^{j\omega_0 t}$
 $= \cos(\omega_0 t) + j \sin(\omega_0 t)$

Periodic with period
 $T_0 = \frac{2\pi}{\omega_0}$

Exponential something that we already seen this forms the basis for the Fourier transform consider the complex exponential signal, that is we have e to the power of the complex exponential remember is something that we have seen very the initial modules, e to the power of j omega naught t, this is cosine omega naught t plus j sine omega naught t, and this is periodic with period and remember this is periodic with period T naught equals 2 pi over omega naught.

(Refer Slide Time: 05:51)

$T_0 = \frac{2\pi}{\omega_0}$

$e^{j\omega_0(t+kT_0)}$
 $= e^{j\omega_0 t + j\omega_0 k \frac{2\pi}{\omega_0}}$
 $= e^{j\omega_0 t + j2\pi k}$
 $= e^{j\omega_0 t} \cdot \frac{e^{j2\pi k}}{1}$
 $= e^{j\omega_0 t}$

And this can be seen as follows for instance if you consider $e^{j\omega_0 t}$ to the power of $j\omega_0 t$ plus kT , this is equal to $e^{j\omega_0 t + j\omega_0 kT}$ which is $e^{j\omega_0 t} e^{j2\pi k}$ because $\omega_0 T = 2\pi$. So, this is periodic with period T , $T = 2\pi / \omega_0$.

So, these ω_0 cancel and what is remaining is $e^{j\omega_0 t}$ plus $j2\pi k$ which is $e^{j\omega_0 t} e^{j2\pi k}$ remember $e^{j2\pi k} = 1$ which is basically $e^{j\omega_0 t}$. So, this is periodic with period T , $T = 2\pi / \omega_0$.

(Refer Slide Time: 07:01)

The image shows a whiteboard with handwritten mathematical relationships. At the top, it states $T_0 = \frac{2\pi}{\omega_0}$ and labels T_0 as the 'Fundamental Period'. Below this, it states $\omega_0 = \text{Fundamental Angular Frequency}$. At the bottom, it shows the derivation $F_0 = \frac{2\pi}{T_0} \Rightarrow \omega_0 = 2\pi F_0$, with F_0 labeled as 'Fundamental Frequency'.

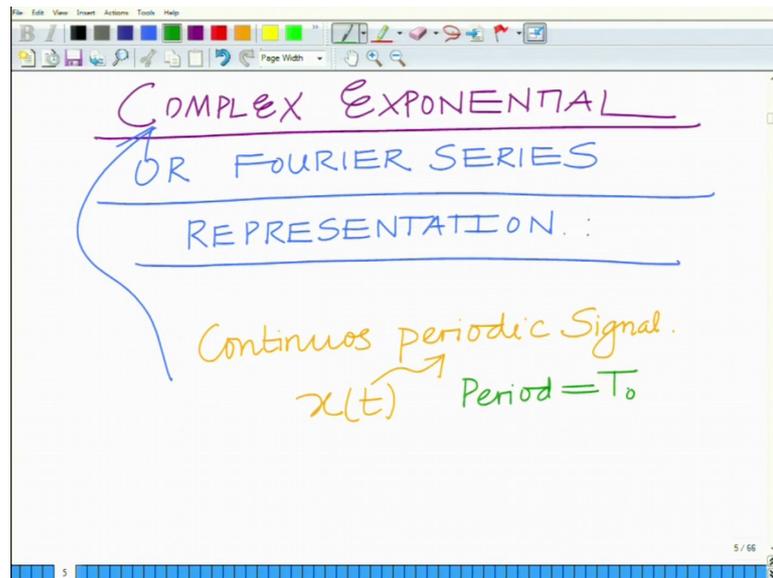

So, T equals $2\pi / \omega_0$ this is the period or the fundamental period of the signal also known as the fundamental period ok.

This is the period of the fundamental period and ω_0 now this quantity, ω_0 is the angular frequency in fact, this is the fundamental. This nomenclature will become clear slightly later, this is the fundamental angular frequency. And if you consider F remember $F = \omega_0 / 2\pi$ or basically this implies $\omega_0 = 2\pi F$, this is known as the fundamental frequency ok.

So, we have a complex exponential $e^{j\omega_0 t}$ that is periodic with T the fundamental period $T = 2\pi / \omega_0$, ω_0

naught omega naught is the fundamental angular frequency if not equals omega naught over 2 pi or omega naught equals 2 pi f naught f naught is the fundamental frequency all right. And now let us look at the complex exponential let us look at what is known as the complex exponential or the Fourier series representation.

(Refer Slide Time: 09:00)

So, what we want to look at now is the complex exponential or basically a Fourier series representation. Complex exponential or Fourier series representation and this is defined for continuous periodic signal remember this kind of representation for a continuous.

So, this is defined for a signal $x(t)$, which is basically continuous and periodic and let us say the period is T or let us say period equals T naught, it is also called this as fundamental period.

(Refer Slide Time: 10:34)

$x(t)$ Fundamental Period = T_0

$$x(t) = \sum_{k=-\infty}^{\infty} c_k e^{jk\omega_0 t}$$

$\omega_0 = \frac{2\pi}{T_0}$

sum of complex Exponential signals
Frequency ω_0 and
Various Harmonics $k\omega_0$

Let us call this as a fundamental period the fundamental period equals T_0 . So, we have a periodic signal $x(t)$ with fundamental period T_0 , then it says that, this $x(t)$ can be represented as the sum of complex exponentials. That is if $x(t)$ is a continuous signal and periodic with fundamental period T_0 , then it can be represented as the sum of complex exponentials as follows and that is basically the Fourier series representation. So, this $x(t)$ can be represented as summation k equals minus infinity to infinity, $C_k e^{jk\omega_0 t}$.

So, it can be represented as the sum of complex and remember ω_0 equals $2\pi/T_0$. So, what we have is basically remember $x(t)$ can be expressed as a sum of complex exponentials. So, we are expressing it as some of complex exponentials, at the fundamental frequency ω_0 that is exponentials $e^{jk\omega_0 t}$ at the fundamental frequency ω_0 and k a times ω_0 , these are known as the harmonics that is their frequencies are basically multiples of the fundamental frequency.

So, they are at the fundamental frequency ω_0 , and multiples of the fundamental frequency ω_0 that is k times ω_0 or the various harmonics corresponding to ω_0 ; and $x(t)$ can be expressed as sum of such complex exponential signals. So, $x(t)$ can be expressed as the sum of complex some of complex exponential signals come up at the frequency ω_0 and the various

harmonics at $k\omega$ where k is; obviously, an integer that is harmonics at frequency ω equals $k\omega$ naught ok.

So, it can be expressed as a sum of complex exponential signals, at the fundamental frequency ω naught and the various harmonics, which correspond to the frequencies that are integer multiples of ω naught it is $k\omega$ naught; and $x(t)$ can be expressed as the sum of an infinite number of such complex exponentials. And this is a very important property and as we will see this yields a very convenient, and as a very tractable is a very tractable and a convenient method for representation of a periodic signal that yields various insights about its properties and behavior. Now these coefficients are the C_k s these are the Fourier series coefficients.

So, these are the Fourier coefficients the C_k s.

(Refer Slide Time: 14:15)

The image shows a whiteboard with handwritten text and equations. At the top, it says "Various Harmonics $k\omega_0$ ". Below that, it says "Fourier Series Coefficients" with an arrow pointing to C_k . The main equation is:

$$C_k = \frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt$$

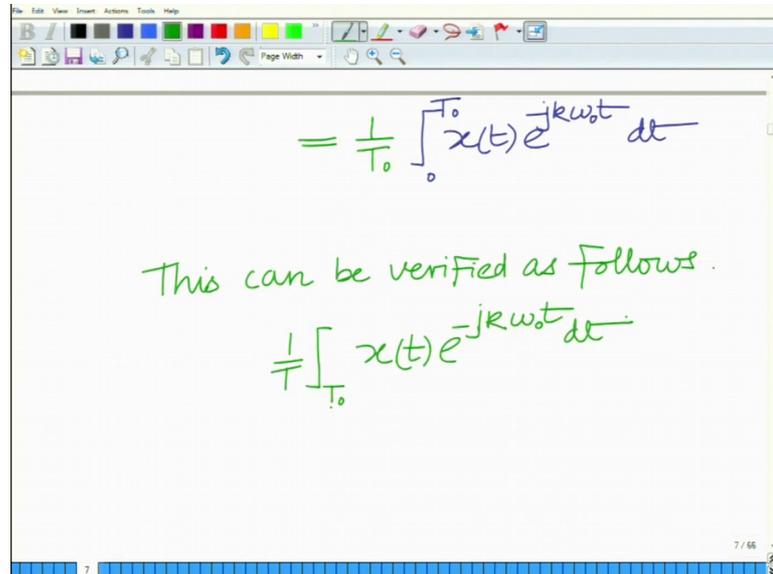

$$= \frac{1}{T_0} \int_{-T_0/2}^{T_0/2} x(t) e^{-jk\omega_0 t} dt$$

The whiteboard also has a toolbar at the top and a status bar at the bottom showing "6 / 66".

These are the Fourier series coefficients these are the Fourier series coefficients corresponding to of course, the harmonic that is e raised to $j k \omega$ naught. And this C_k s can be obtained as follows C_k equals 1 over T naught integral over any fundamental period T naught over any duration that spans T naught contiguous duration, $x(t)$ e raised to minus $j k \omega$ naught dt . And this can be any interval of length T naught for instance it can be minus T naught by 2 to T naught by 2 .

So, this can be $\frac{1}{T_0}$ times the integral from 0 to T_0 of $x(t) e^{jk\omega_0 t} dt$. So, this can be integral from 0 to T_0 or any contiguous interval of spanning of length T_0 . In fact, this can be $T_0/2$ to $3T_0/2$ or it can be $T_0/2$ to $3T_0/2$. So, it can be any continuous duration spanning the length T_0 and this can be seen as follows this can be readily seen as follows this can be verified as follows now consider C_k or consider integral over t not or consider let us say $\frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt$, now I can.

(Refer Slide Time: 15:29)

These are just some things that you can typically employ for the sake of convenience $\frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt$. So, this can be integral from 0 to T_0 or $T_0/2$ to $3T_0/2$ or any contiguous interval of spanning of length T_0 . In fact, this can be $T_0/2$ to $3T_0/2$ or it can be $T_0/2$ to $3T_0/2$. So, it can be any continuous duration spanning the length T_0 and this can be seen as follows this can be readily seen as follows this can be verified as follows now consider C_k or consider integral over t not or consider let us say $\frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt$, now I can.

(Refer Slide Time: 16:50)

$$= \frac{1}{T_0} \int_{-T_0}^{T_0} \left(\sum_{l=-\infty}^{\infty} c_l e^{j l \omega_0 t} \right) e^{-j k \omega_0 t} dt$$

$x(t)$

$$= \sum_{l=-\infty}^{\infty} c_l \cdot \frac{1}{T_0} \int_{-T_0}^{T_0} e^{j(l-k)\omega_0 t} dt$$

Now, first what I am going to do here is I am going to substitute evaluate over interval of duration T naught, I am going to substitute the expression for $x t$, which is I am using a different index l equals minus infinity to infinity, $C l$ e raised to $j l$ omega naught t , I am using a different index l . So, that I do not confuse with k times e raised to minus $j k$ omega naught t dt remember all I am doing is substituting the expression for $x t$. Now I am going to interchange the integral and summation.

So, I will bring the summation outside, I am going to take the integral inside. In fact, this 1 over T naught this 1 over T naught is also constant factor. So, I can also move it inside and outside the integral all right. So, that does not create any problem. So, this is going to be summation l equals minus infinity to infinity $C l$ times 1 over T naught integral 1 over T naught integral, now you can see I can combine these 2 exponential terms integral over T naught e raise to $j l$ minus k omega naught t dt .

(Refer Slide Time: 18:41)

Handwritten mathematical derivations on a whiteboard:

If $l = k$

$$\frac{1}{T_0} \int_{T_0} 1 \cdot dt = \frac{1}{T_0} \times T_0 = 1$$

If $l \neq k$ $l - k = m$

$$\frac{1}{T_0} \int_{T_0} e^{j m \omega_0 t} dt$$

And now, consider look at this integral, I want to draw your attention towards this integral. Now $\frac{1}{T}$ $\int_0^T e^{j(l-k)\omega_0 t} dt$, integral over duration T . Now if l equals k this integral becomes $\frac{1}{T} \int_0^T 1 dt$ or integral of duration T $\int_0^T 1 dt$, which is $\frac{1}{T} \times T$, which is equal to 1. Now if l is not equal to k then this becomes $\frac{1}{T} \int_0^T e^{j m \omega_0 t} dt$, this is an integral over integral of a harmonic over one fundamental period. So, this is integral of a harmonic.

(Refer Slide Time: 19:51)

The image shows a whiteboard with handwritten mathematical derivations. At the top, there is an integral expression: $\frac{1}{T_0} \int_0^{T_0} e^{j l \omega_0 t} dt$. A bracket under the integral is labeled "integral of Harmonics over fundamental Period". Below this, it is stated that the result is $= 0$. The second part of the derivation shows the integral: $\frac{1}{T_0} \int_0^{T_0} e^{j(l-k)\omega_0 t} dt = \begin{cases} 1 & l=k \\ 0 & l \neq k \end{cases}$. This result is underlined and labeled $\delta(l-k)$.

Now, remember corresponding to the fundamental frequency, any harmonic is also periodic. That is if the complex exponential $e^{j l \omega_0 t}$ has fundamental period T_0 , then T_0 is also a period although not a fundamental period. T_0 is also a period of $e^{j m \omega_0 t}$, $m \omega_0 t$ alright. So, when you integrate this over one fundamental period, when you integrate this complex sinusoid over one fundamental period the integral vanishes. It is like taking a sinusoid or taking a sinusoid integrating over a multiple of its period, the integral vanishes. Therefore, this integral is 0 if $l \neq k$ which is equal to 0.

And therefore, as a result what you will have is that this integral $\frac{1}{T_0} \int_0^{T_0} e^{j(l-k)\omega_0 t} dt$, this is equal to 1 if $l = k$ and 0 if $l \neq k$. This is the integral over fundamental period. This vanishes and therefore, you can also say that, this quantity is basically nothing, but $\delta(l-k)$. That is this is equal to 1 if $l = k$, $l - k = 0$ there is a discrete delta function or this is equal to basically this is equal to 0 if $l \neq k$. Therefore, what we are going to have here

(Refer Slide Time: 21:54)

Handwritten mathematical derivation on a whiteboard:

$$= \sum_{l=-\infty}^{\infty} c_l \cdot \frac{1}{T_0} \int_{T_0} e^{j(l-k)\omega_0 t} dt$$

$$= \sum_{l=-\infty}^{\infty} c_l \delta(l-k)$$

If $l = k$

$$\frac{1}{T_0} \int_{T_0} 1 \cdot dt = \frac{1}{T_0} \times T_0 = 1$$

If $l \neq k$ $l - k = m$

$$\frac{1}{T_0} \int_{T_0} e^{jm\omega_0 t} dt$$

is basically if you substitute this here you will have summation l equal to minus infinity to infinity $C_l \delta(l - k)$.

(Refer Slide Time: 22:12)

Handwritten mathematical derivation on a whiteboard:

$$\frac{1}{T_0} \int_{T_0} e^{j(l-k)\omega_0 t} dt = \delta(l-k)$$

$dt = \begin{cases} 0 & l \neq k \end{cases}$

$$\frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt = \sum_{l=-\infty}^{\infty} c_l \delta(l-k)$$

$$= c_k$$

So, this is so, we have that we just write it 1 over T naught $\times t$ e raise to minus J ω or e raise to minus $J k$ ω naught t dt , e raised to minus jk ω naught t dt , this is equal to summation l equal to minus infinity to infinity $C_l \delta(l - k)$ well $\delta(l - k)$ is 1 . If l equals k is 0 if n is not equal to k therefore, the result of this summation

is C_k because for all other $l \neq k$ $\delta_{l-k} = 0$ it only survives when l is equal to k .

So, this is equal to C_k and therefore, we have demonstrated that basically we have C_k the k th Fourier coefficient can be evaluated as $\frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt$.

(Refer Slide Time: 23:08)

The image shows a handwritten derivation of the formula for the k th Fourier coefficient. At the top, there is a red integral expression: $\int_{T_0}^{T_0} = C_k$. Below this, the main formula is written in green: $C_k = \frac{1}{T_0} \int_{T_0} x(t) e^{-jk\omega_0 t} dt$. An arrow points from the text " k th Fourier Coefficient" to the C_k term in the equation. The background is a whiteboard with a toolbar at the top and a blue progress bar at the bottom.

This is the k th Fourier coefficient corresponding to the complex exponential, e raised to j corresponding to the complex exponential e raised to $j k$ times $\omega_0 t$ that is basically corresponding to the k th harmonic at the frequency k times ω_0 , where ω_0 is the fundamental angular frequency and of course, if you look at ω_0 let us say k equal to 0 here.

(Refer Slide Time: 23:56)

$$C_0 = \frac{1}{T_0} \int_{-T_0}^{T_0} x(t) dt$$

$k=0$

DC coefficient $k=0$ Freq.

mean or average of $x(t)$ over period.

C_k or C_0 in fact, this is equal to $C_0 = \frac{1}{T} \int_{-T/2}^{T/2} x(t) e^{j k \omega t} dt$ is simply $e^{j k \omega t}$ raised to 0 that is 1 times dt and if you can see this, this is simply the mean or average of $x(t)$ over the interval T .

This is mean or average of $x(t)$ or one period, that is T and this C_0 corresponds to zero frequency, that is $k=0$ this is also known as the DC coefficient corresponds to the zero frequency. So, that corresponds to the zero frequency. So, this is also known as the dc coefficient and basically that is your C_0 all right.

So, what we have done in this module is, we have introduced this new concept or we are starting our discussion on Fourier analysis the Fourier analysis of continuous time signals and continuous time signals and systems are in particular we are starting with the continuous time with a continuous time periodic signal with fundamental period, T and we have looked at the Fourier series expansion of that and how to derive the coefficients in the Fourier series of $x(t)$. So, we will stop here and continue in subsequent modules.

Thank you very much.
