Example Problems in Signals and Systems – Properties of Modulator, Eigenfunction of LTI System

(Refer Slide Time: 00:25)

Hello, welcome to another module in this massive open online course. So, we are looking at examples of LTI systems or we are solving problems related to LTI systems. So, let us continue looking at this discussion that is LTI systems. And we are we are solving problems. So, the problem that in currently trying to address is whether this modulation by carrier that is $y(t) = x(t) \cos(2\pi f_c t)$ is this a we are trying to address if this is an LTI system. Now, to do that first let us check linearity is this is a linear system. Remember for LTI an LTI system has to be both linear and time invariant.

(Refer Slide Time: 01:46)

$$\text{ADDITIVITY: } T(x_1(t)) = \frac{x_1(t) \cos(2\pi Fct)}{y_1(t)}$$
$$T(x_2(t)) = \frac{x_2(t) \cos(2\pi Fct)}{y_2(t)}$$
$$T(x_1(t) + x_2(t)) = \frac{(x_1(t) + x_2(t)) \times \cos(2\pi Fct)}{}$$

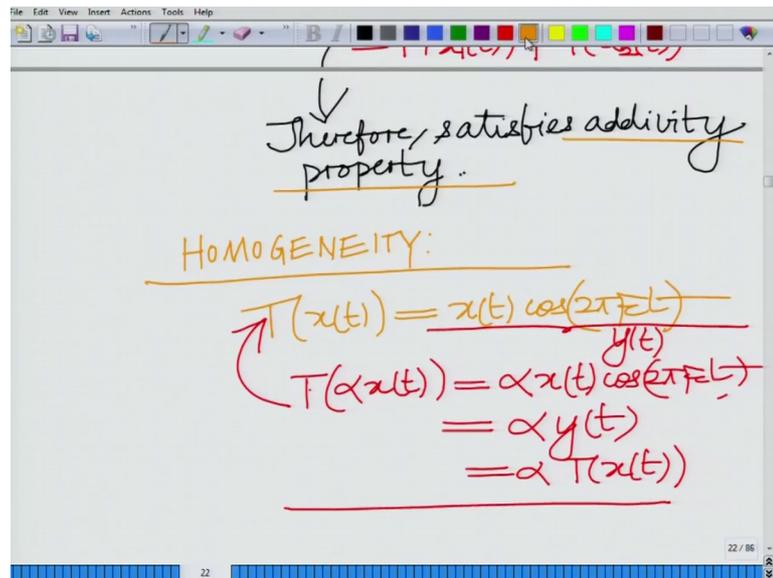

So, let us first check linearity; to check linearity we have to see if it is additive and homogeneous. So, satisfies the additivity and homogeneity property. So, additivity coming now first, to additivity we have let us say $x_1(t)$ equals $x_1(t) \cos(2\pi Fct)$ this is your $y_1(t)$. Similarly, T of $x_2(t)$ equals $x_2(t) \cos(2\pi Fct)$ this is your $y_2(t)$. Now, T of $x_1(t) + x_2(t)$, this is equal to you can see that is your modulating signal $x_1(t) + x_2(t)$ times $\cos(2\pi Fct)$.

(Refer Slide Time: 03:04)

$$T(x_1(t) + x_2(t)) = \frac{(x_1(t) + x_2(t)) \times \cos(2\pi Fct)}{}$$
$$= \frac{x_1(t) \cos(2\pi Fct)}{y_1(t)} + \frac{x_2(t) \cos(2\pi Fct)}{y_2(t)}$$
$$= y_1(t) + y_2(t)$$
$$= T(x_1(t)) + T(x_2(t))$$

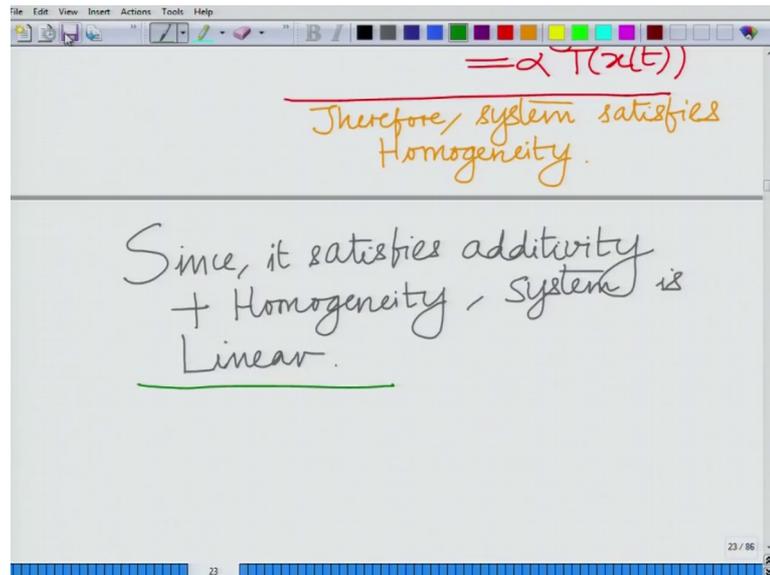

Which is again $x_1(t) \cos(2\pi F C t)$ that is $y_1(t)$ plus $x_2(t) \cos(2\pi F C t)$ which is $y_2(t)$. So, this is T of $x_1(t) + x_2(t)$ equals $y_1(t) + y_2(t)$ that is basically T of $x_1(t) + x_2(t)$. So, therefore, it satisfies the additivity property. Therefore, it satisfies the additivity property. So, we have seen that it satisfies the additivity property.

(Refer Slide Time: 03:54)

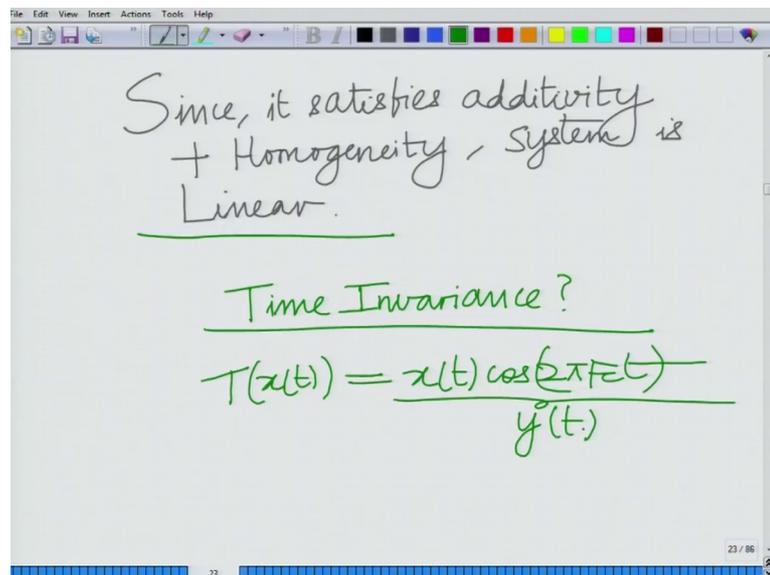

Now, how are the other property in linearity is homogeneity all right. So, we have to check if it satisfies the homogeneity property. So, what we want to check next is homogeneity. So, let us say again T of $x(t)$ equals $x(t) \cos(2\pi F C t)$. Now T of $\alpha x(t)$, so this is your $y(t)$, T of $\alpha x(t)$ naturally this is equal to $\alpha x(t) \cos(2\pi F C t)$, which you can clearly see it is $\alpha y(t)$ which is basically αT of $x(t)$. Therefore, system is again T of $\alpha x(t)$ is αT of $x(t)$. Therefore, system satisfies homogeneity property therefore, system satisfies homogeneity.

(Refer Slide Time: 05:30)

So, we have additivity, homogeneity. So, system satisfies both additivity and homogeneity properties, therefore the system is linear. So, the modulator, the modulation system is a linear system. Therefore, since additivity plus homogeneity system is linear system; it is a linear system.

(Refer Slide Time: 06:54)

Now, how about time invariance, it is a time invariant. How about the time invariance property? Let to address that let us look at T of x t that is equal to x t cosine 2 pi F C t this is your y t.

(Refer Slide Time: 07:26)

Time Invariance?

$$T(x(t)) = \frac{x(t) \cos(2\pi Fct)}{y(t)}$$

Delayed input

$$T(x(t-t_0)) = x(t-t_0) \cos(2\pi Fct)$$
$$\neq y(t-t_0)$$
$$= x(t-t_0) \cos(2\pi Fct(t-t_0))$$

Now, for time invariance, we have to consider a delayed input or shifted input x of t minus t_0 . This is your delayed input, this is equal to x of t minus t_0 into cosine $2\pi F C t$. And now you see you have a problem here this is not equal to y of t minus t_0 , where y of t minus t_0 you can see is x of t minus t_0 into cosine $2\pi F C t$ minus t_0 , so that is the problem.

(Refer Slide Time: 08:24)

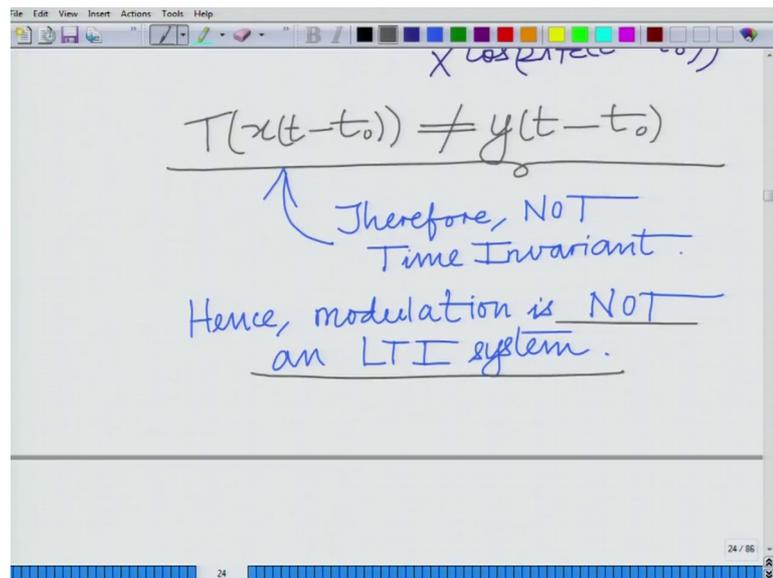

$$\neq y(t-t_0)$$
$$= x(t-t_0) \cos(2\pi Fct(t-t_0))$$
$$T(x(t-t_0)) = x(t-t_0) \cos(2\pi Fct)$$

Therefore, NOT Time Invariant.

What you can see here is that interestingly T of x of t minus t_0 is not equal to y of t minus t_0 that is if you delay the input, the resulting output is not the output

corresponding to the previous that is not the output corresponding to $x(t)$ delayed similarly. These two things are different that is $T(x(t-t_0)) \neq y(t-t_0)$ therefore the system is not time invariant that is an important observation. Therefore, hence it is not an LTI system, because system is LTI only if it is both linear and time invariant, this system is linear, but not time invariant. Hence, it is not an LTI system.

(Refer Slide Time: 09:35)

The image shows a whiteboard with handwritten text. At the top, there is a faint header "X cos(2πf_c t + φ)". Below it, the equation $T(x(t-t_0)) \neq y(t-t_0)$ is written. An arrow points from this equation to the text "Therefore, NOT Time Invariant." Below that, it says "Hence, modulation is NOT an LTI system." The whiteboard interface includes a menu bar (File, Edit, View, Insert, Actions, Tools, Help), a toolbar with various drawing tools, and a status bar at the bottom showing "24 / 66".

It is linear, but not time invariant hence the modulation operation or modulator subsystem is not modulation is not linear time invariant system, this is not an LTI system, so that is the important aspect that you have to understand. Sometimes, it is not obvious. So, it is a linear system, but it is not a time invariant system.

(Refer Slide Time: 10:27)

an LTI system.

EX: Let $T(\cdot)$ represent an LTI system. Show,

$$T(e^{j2\pi ft}) = c e^{j(2\pi ft)}$$

input = complex sinusoid.

output = complex sinusoid $\times c$
 $c = \text{constant}$

And let us do one final example to understand something. So, let us do another final example for an LTI system or consider let the transformation represent, let this represent a LTI system. Now, for this if this represents an LTI system, then show that T of e to the power of $j 2 \pi F$ naught t for any frequency F naught equals that is if you consider any input which is a complex sinusoid. And this is a very interesting property for a pure for a complex sinusoid, the output is some constant C times e to the power of $j 2 \pi F$ naught n . This is a very interesting property that is basically output to any complex that is if you consider an LTI system output, if the input is a complex sinusoid, the output is also a complex sinusoid simply scaled by another constant c . And this is a very interesting result. Output is a complex sinusoid scaled by X , where C equals this C equals a constant. And input is a complex sinusoids then output is also a complex sinusoid scaled by C , this can be shown as follows.

(Refer Slide Time: 12:30)

input = complex sinusoid.

output = complex sinusoid
 $\times C$
 $C = \text{constant}$

$$T(e^{j2\pi Ft}) = y(t)$$

Since LTI, $\Rightarrow T(e^{j2\pi F(t-t_0)}) = y(t-t_0)$

Since we have let t to the power of $j 2 \pi F$ naught t let this be equal to $y t$. Since, LTI since the system is shown to be LTI, it is a linear time invariant system, this implies $T e$ to the power of $j 2 \pi F t$ minus t naught equals y of t minus t naught, but $t e$ to power of $j 2 \pi F t$ minus t naught. This is equal to $T e$ to the power of $j 2 \pi F t$ e to the power of minus $j 2 \pi e$ to the power of minus $j 2 \pi f$ naught t naught, which is equal to y of t minus t naught.

(Refer Slide Time: 13:15)

$$\Rightarrow T(e^{j2\pi Ft} e^{-j2\pi Ft_0}) = y(t-t_0)$$

Scaling Factor α

Now, look at this e to the power of minus $j 2 \pi F$ naught t naught this is simply a scaling factor because F naught is a constant, t naught the delay is a constant I mean we are assume. So, this is simply a scaling factor you can see this is similar to your scaling factor α .

(Refer Slide Time: 14:14)

The image shows a whiteboard with handwritten mathematical derivations. At the top, there is a purple arrow pointing from $T(e^{-j2\pi Ft_0})$ to $y(t-t_0)$. Below this, the text "Scaling Factor α " is written in blue. The derivation proceeds as follows:

$$\Rightarrow e^{-j2\pi Ft_0} T(e^{j2\pi Ft}) = y(t-t_0)$$

$$\Rightarrow y(t) \cdot e^{-j2\pi Ft_0} = y(t-t_0) \quad \forall t, t_0.$$

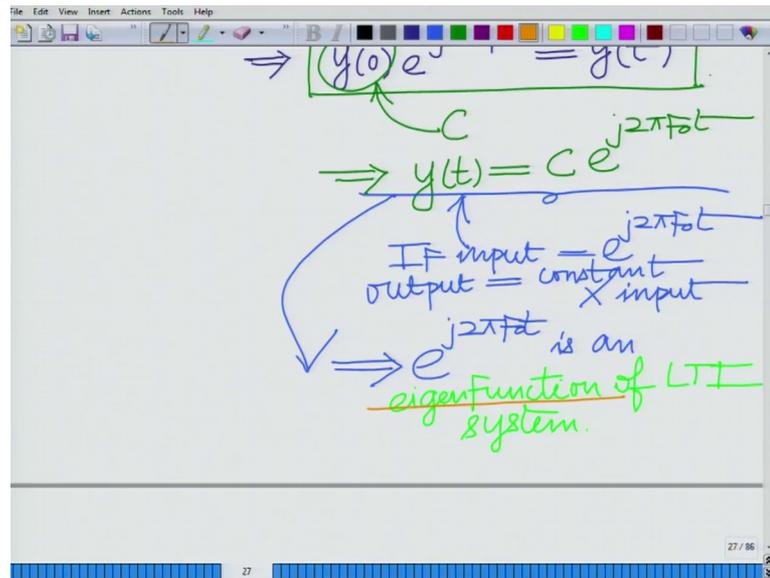

So, using now homogeneity this implies from LTI this implies e to the power of minus $j 2 \pi F$ naught t naught into T of e to the power of $j 2 \pi F$ naught t equals y of t minus t naught, but $t e$ to the power of $j 2 \pi F$ naught t this is nothing but y of t . So, what we have, so this is y of t . So, what we have is basically this implies y of t into e to the power of minus $j 2 \pi F$ naught t naught because y of t minus t naught and this holds for all t naught of course, this also all t comma t naught.

(Refer Slide Time: 15:23)

The image shows a whiteboard with handwritten mathematical derivations. At the top, it says "Set $t = 0$ " and " $t_0 = -t$ ". Below this, the equation $y(0)e^{j2\pi Ft} = y(t)$ is written and enclosed in a green box. An arrow points from the $y(0)$ term to the letter C . Below this, the equation $y(t) = Ce^{j2\pi Ft}$ is written. At the bottom, it says "If input = $e^{j2\pi Ft}$ " and "output = constant \times input".

Now, set t equal to 0, and t_0 equals minus t this implies $y(0)e^{-j2\pi Ft} = y(t)$ so we are setting t_0 equal to minus t $e^{-j2\pi Ft} = y(t)$. So, what we have been able to show is that $y(0)$ equals $y(t)$ equals now this is $y(0)$ you can call this as your constant C . So, what we have shown is that $y(t)$ this implies $y(t) = Ce^{j2\pi Ft}$. So, output is simply scaled version of input that is this shows if input equals $e^{j2\pi Ft}$, output equals some constant factor times the input. So, output is simply some constant times the input such an input is known as an eigenfunction. So, $e^{j2\pi Ft}$ is an eigenfunction of the LTI system, because output is simply a scaled version of the input.

(Refer Slide Time: 17:18)

Hence this implies, this is a very interesting property, this implies e to the power of $j 2 \pi f$ naught t is an eigenfunction. This is a very interesting property is an eigenfunction of an LTI system for that matter is an eigenfunction of any LTI system e to the power of $j 2 \pi f$ naught t this has a very special relevance of course, we are going to explore it further through the various modules. But it is important to realize that this function this complex sinusoid has a very important relevance correct, in the context of analysis of LTI systems because this is an eigen function of any LTI system all right.

So, with that we will wrap up our example section. So, hopefully we have done several examples which are hopefully to some extent have covered various aspects of the principles of signals and systems or the various introductory let us say introductory principles of signals and systems classification of signals and systems that we have seen so far, and we will look at other aspects in the subsequent modules.

Thank you very much.
