Lecture - 13
Variational Approach To Optimal Control Systems (Continued)

Welcome to all of you. In today's lecture we will continue with the variational approach to optimal control system. Just to quick review in the previous class we have start our problem on the variational approach, it is applicable to optimal control system we considered a plant \dot{x} with condition, initial point is given, final point is free, we consider our performance index as J equal to with terminal cost and integral cost which is given here.

(Refer Slide Time: 00:53)

Variational Approach to Optimal Control Systems

Consider the performance index is of general form containing a terminal cost function in addition to the integral cost function

$$J(\mathbf{u}(t)) = S(\mathbf{x}(t_f), t_f) + \int_{t_0}^{t_f} V(\mathbf{x}(t), \mathbf{u}(t), t) dt$$

Consider

$$\int_{t_0}^{t_f} \frac{dS(\mathbf{x}(t), t)}{dt} dt = S(\mathbf{x}(t), t)|_{t_0}^{t_f} = S(\mathbf{x}(t_f), t_f) - S(\mathbf{x}(t_0), t_0)$$

IIT ROORKEE NPTEL ONLINE CERTIFICATION COURSE

With a mathematical consideration we define our PIS, V plus dS by dt and plant is this. So, objective is to find out the optimal u which will minimize the J and satisfy the plant. Our approach is the Lagrangian approach.

(Refer Slide Time: 01:00)

Variational Approach to Optimal Control Systems

The performance Index can be written as

$$J_2(\mathbf{u}(t)) = \int_{t_0}^{t_f} \left[V(\mathbf{x}(t), \mathbf{u}(t), t) + \frac{dS}{dt} \right] dt$$
$$= \int_{t_0}^{t_f} V(\mathbf{x}(t), \mathbf{u}(t), t) dt + S(\mathbf{x}(t_f), t_f) - S(\mathbf{x}(t_0), t_0)$$

The optimization of the original performance index J is equivalent to that of the performance index J_2 . However, the optimal cost is different

Also

$$\frac{d[S(\mathbf{x}(t), t)]}{dt} = \left(\frac{\partial S}{\partial \mathbf{x}} \right)' \dot{\mathbf{x}}(t) + \frac{\partial S}{\partial t}$$

(Refer Slide Time: 01:05)

Variational Approach to Optimal Control Systems

Assume optimum values $\mathbf{x}^*(t)$ and $\mathbf{u}^*(t)$ for state and control

PI $J(\mathbf{u}^*(t)) = \int_{t_0}^{t_f} \left[V(\mathbf{x}^*(t), \mathbf{u}^*(t), t) + \frac{dS(\mathbf{x}^*(t), t)}{dt} \right] dt$

Plant $\dot{\mathbf{x}}^*(t) = \mathbf{f}(\mathbf{x}^*(t), \mathbf{u}^*(t), t)$

So, first we define our Lagrangian L as V plus λ prime g , g is this is our condition which we have taken in the previous lecture.

(Refer Slide Time: 01:18)

Variational Approach to Optimal Control Systems

The state equation and the performance index become

$$\dot{\mathbf{x}}^*(t) + \delta\dot{\mathbf{x}}(t) = \mathbf{f}(\mathbf{x}^*(t) + \delta\mathbf{x}(t), \mathbf{u}^*(t) + \delta\mathbf{u}(t), t)$$
$$J(\mathbf{u}(t)) = \int_{t_0}^{t_f + \delta t_f} \left[V(\mathbf{x}^*(t) + \delta\mathbf{x}(t), \mathbf{u}^*(t) + \delta\mathbf{u}(t), t) + \frac{dS}{dt} \right] dt$$

(Refer Slide Time: 01:24)

Variational Approach to Optimal Control Systems

Define the Lagrangian function at optimal condition as

$$\begin{aligned} \mathcal{L} &= \mathcal{L}(\mathbf{x}^*(t), \dot{\mathbf{x}}^*(t), \mathbf{u}^*(t), \boldsymbol{\lambda}(t), t) \\ &= V(\mathbf{x}^*(t), \mathbf{u}^*(t), t) + \left(\frac{\partial S}{\partial \mathbf{x}} \right)'_* \dot{\mathbf{x}}^*(t) + \frac{\partial S}{\partial t} \\ &\quad + \boldsymbol{\lambda}'(t) \{ \mathbf{f}(\mathbf{x}^*(t), \mathbf{u}^*(t), t) - \dot{\mathbf{x}}^*(t) \} \end{aligned}$$

So, these wholes define the V plus lambda prime and this is my g. So, this is my Lagrangian at the optimal point, define Lagrangian at the variation point.

(Refer Slide Time: 01:43)

Variational Approach to Optimal Control Systems

At any other condition as

$$\begin{aligned} \mathcal{L}^\delta &= \mathcal{L}^\delta(\mathbf{x}^*(t) + \delta\mathbf{x}(t), \dot{\mathbf{x}}^*(t) + \delta\dot{\mathbf{x}}(t), \mathbf{u}^*(t) + \delta\mathbf{u}(t), \lambda(t), t) \\ &= V(\mathbf{x}^*(t) + \delta\mathbf{x}(t), \mathbf{u}^*(t) + \delta\mathbf{u}(t), t) \\ &\quad + \left(\frac{\partial S}{\partial \mathbf{x}}\right)'_* [\dot{\mathbf{x}}^*(t) + \delta\dot{\mathbf{x}}(t)] + \left(\frac{\partial S}{\partial t}\right)_* \\ &\quad + \lambda'(t) [\mathbf{f}(\mathbf{x}^*(t) + \delta\mathbf{x}(t), \mathbf{u}^*(t) + \delta\mathbf{u}(t), t) \\ &\quad - \{\dot{\mathbf{x}}^*(t) + \delta\dot{\mathbf{x}}(t)\}]. \end{aligned}$$

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE

(Refer Slide Time: 01:49)

Variational Approach to Optimal Control Systems

Define increment ΔJ

$$\begin{aligned} \Delta J &= J_a(\mathbf{u}(t)) - J_a(\mathbf{u}^*(t)) \\ &= \int_{t_0}^{t_f} (\mathcal{L}^\delta - \mathcal{L}) dt + \mathcal{L}|_{t_f} \delta t_f \end{aligned}$$

The first variation δJ

$$\begin{aligned} \delta J &= \int_{t_0}^{t_f} \left\{ \left(\frac{\partial \mathcal{L}}{\partial \mathbf{x}}\right)'_* \delta\mathbf{x}(t) + \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \delta\dot{\mathbf{x}}(t) + \left(\frac{\partial \mathcal{L}}{\partial \mathbf{u}}\right)'_* \delta\mathbf{u}(t) \right\} dt \\ &\quad + \mathcal{L}|_{t_f} \delta t_f \end{aligned}$$

 IIT ROORKEE
  NPTEL ONLINE CERTIFICATION COURSE

Find out the increment delta J as J u t minus J u star t which nothing but from this increment we find out the first variation delta J which is given with this expression plus L t f delta t f.

(Refer Slide Time: 02:15)

Variational Approach to Optimal Control Systems

For IInd term Integrating by parts

$$\begin{aligned}\int_{t_0}^{t_f} \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \delta \dot{\mathbf{x}}(t) dt &= \int_{t_0}^{t_f} \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \frac{d}{dt} (\delta \mathbf{x}(t)) dt \\ &= \left[\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \delta \mathbf{x}(t) \right]_{t_0}^{t_f} \\ &\quad - \int_{t_0}^{t_f} \left[\frac{d}{dt} \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \right] \delta \mathbf{x}(t) dt\end{aligned}$$

IIT ROORKEE | NPTEL ONLINE CERTIFICATION COURSE

If the second term which is $\frac{\partial \mathcal{L}}{\partial \mathbf{x}}$ by $\delta \mathbf{x}$, so $\delta \dot{\mathbf{x}}$ we expand by the integral by parts and we get the final equation is $\frac{\partial \mathcal{L}}{\partial \mathbf{x}}$ minus $\frac{d}{dt} \frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}$ dot $\delta \mathbf{x}$ plus \mathcal{L} by $\delta \mathbf{u}$ plus whatever is by terminal condition which is given.

(Refer Slide Time: 02:20)

Variational Approach to Optimal Control Systems

since $\mathbf{x}(t_0)$ is specified, $\delta \mathbf{x}(t_0) = 0$. Thus, δJ becomes

$$\begin{aligned}\delta J &= \int_{t_0}^{t_f} \left[\left(\frac{\partial \mathcal{L}}{\partial \mathbf{x}}\right)'_* - \frac{d}{dt} \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \right] \delta \mathbf{x}(t) dt \\ &\quad + \int_{t_0}^{t_f} \left(\frac{\partial \mathcal{L}}{\partial \mathbf{u}}\right)'_* \delta \mathbf{u}(t) dt \\ &\quad + \mathcal{L}|_{t_f} \delta t_f + \left[\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \delta \mathbf{x}(t) \right]_{t_f}.\end{aligned}$$

IIT ROORKEE | NPTEL ONLINE CERTIFICATION COURSE

So, here the 2 variables $\delta \mathbf{x}$ and $\delta \mathbf{u}$ we treat \mathbf{u} to be the independent, \mathbf{x} to be the dependent, we select λ such that the coefficient of the $\delta \mathbf{x}$ will be 0.

(Refer Slide Time: 02:50)

Variational Approach to Optimal Control Systems

The Euler-Lagrange equation $\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)_* - \frac{d}{dt} \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)_* = 0$

The independent control variation $\delta u(t)$ is arbitrary, the coefficient of the control variation $\delta u(t)$ should be set to zero

$$\left(\frac{\partial \mathcal{L}}{\partial \mathbf{u}}\right)_* = 0$$

So, this give me the EL equation as del L by del x dot minus d by dt del L by del x dot equal to 0. So, if this is 0 then independent variable coefficient of delta u will also be 0. So, del L by del u is 0 and my terminal condition is L of t f plus del L by del x dot delta x at t f point that equal to 0. So, up to this we have covered in the previous class.

(Refer Slide Time: 03:09)

Variational Approach to Optimal Control Systems

The first variation reduces to

$$\mathcal{L}^*|_{t_f} \delta t_f + \left[\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \delta \mathbf{x}(t) \right]_{t_f} = 0$$

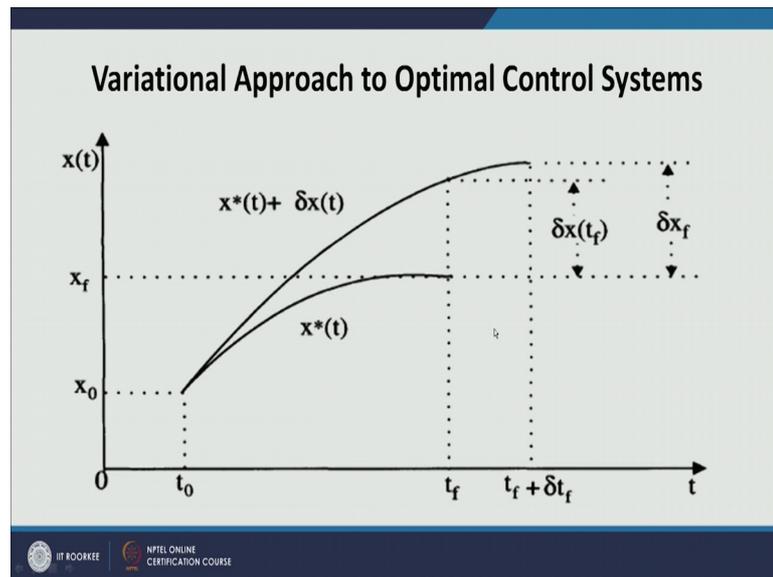

The condition (or plant) equation can be written in terms of the Lagrangian as

$$\left(\frac{\partial \mathcal{L}}{\partial \lambda}\right)_* = 0$$

Now, the terminal condition is given with the delta t f which is the variation at the t f point and delta x of t f.

(Refer Slide Time: 03:36)

(Refer Slide Time: 03:43)

Variational Approach to Optimal Control Systems

$$\dot{x}^*(t_f) + \delta \dot{x}(t_f) \approx \frac{\delta x_f - \delta x(t_f)}{\delta t_f}$$

$$\delta x_f = \delta x(t_f) + \{\dot{x}^*(t) + \delta \dot{x}(t)\} \delta t_f$$

$$\delta x(t_f) = \delta x_f - \dot{x}^*(t_f) \delta t_f.$$

The IIT ROORKEE and NPTEL ONLINE CERTIFICATION COURSE logos are visible at the bottom.

So, if this is the delta x of t f delta x f. So, what I can write? I can approximate x dot of t f plus delta x dot of t f is delta x of minus delta x of t f t f. What is this? Say delta x of t f is what value of the x t at optimal point plus delta x which is the variation point. So, this value will have t f a delta t f point is this value; x f is the value at the t f point and at t f point value of x star of t f del that will be this value. So, difference between these 2 is my delta x of t f and difference between the highest the final value m value of x t at that t f point is delta x f.

So, what we are saying, \dot{x} of t_f value of the optimal point plus what is the δx dot of t_f that we are approximating as δx of t_f minus \dot{x} of t_f at this because this is the value at t_f point and this is the value of t_f plus δt_f point. The difference between these 2 and divided by δt_f the difference between, so this is we are saying nothing but my \dot{x} of t_f plus $\delta \dot{x}$ of t_f . So, this I can approximate with the value δx of t_f minus \dot{x} of t_f divided by δt_f . So, with this value if I will cross multiply this. So, I will get \dot{x} of t_f multiplied with δt_f δx dot of t_f multiplied with the δt_f these 2 value and if I will take is the δx of t_f . So, this equation I can write in this particular form and from here I can find out the value of δx of t_f .

So, what actually we are doing with this expression, the final condition which we have taken as the L star at t equal to t_f point multiplied with δt_f plus δL by δx prime multiplied with δx at t equal to t_f point and I am saying my this condition is equal to 0.

(Refer Slide Time: 06:23)

$$\begin{aligned} \delta \left[L \right]_{t=t_f} + \left[\left(\frac{\partial L}{\partial x} \right)' \delta x(t) \right]_{t=t_f} &= 0 \\ \delta \left[L \right]_{t=t_f} + \left[\left(\frac{\partial L}{\partial x} \right)' \delta x(t_f) \right] &= 0 \\ \delta \left[L \right]_{t=t_f} + \left(\frac{\partial L}{\partial x} \right)' \left[\delta x_f - \dot{x}(t_f) \delta t_f \right] &= 0 \\ \left[L - \left(\frac{\partial L}{\partial x} \right)' \dot{x}(t) \right]_{t=t_f} + \left(\frac{\partial L}{\partial x} \right)' \delta x_f &= 0 \end{aligned}$$

So, in this condition I will place δx of t_f S δx of t_f and t_f point δt_f plus and δx of t_f which is this. So, I take δL by δx prime and δx of t_f and this is also t equal to t_f point, so this equal to 0. So, this δx of t_f I am replacing with δx of t_f this is my δx of t_f minus \dot{x} of t_f δt_f and this equal to 0.

(Refer Slide Time: 08:47)

Variational Approach to Optimal Control Systems

The general boundary condition in terms of the Lagrangian as

$$\left[\mathcal{L}^* - \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}} \right)'_{\mathbf{x}^*} \dot{\mathbf{x}}(t) \right] \Big|_{t_f} \delta t_f + \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}} \right)'_{\mathbf{x}^*} \Big|_{t_f} \delta \mathbf{x}_f = 0.$$

 IIT ROORKEE  NPTL ONLINE
CERTIFICATION COURSE

So, I can club this $\mathcal{L} \delta t_f$, this δt_f term I can club together to get my final relation as $\mathcal{L} \delta t_f$. So, this is nothing but $\mathcal{L} \delta t_f$ minus $\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}} \right)'_{\mathbf{x}^*} \dot{\mathbf{x}}(t) \delta t_f$ multiplied with $\dot{\mathbf{x}}(t)$ this I will evaluate at t equal to t_f point plus $\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}} \right)'_{\mathbf{x}^*} \delta \mathbf{x}_f$ and this sum I will integrate t equal to t_f and this equal to 0.

So, my final condition will be can be represented by this equation which is $\mathcal{L} \delta t_f$ minus $\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}} \right)'_{\mathbf{x}^*} \dot{\mathbf{x}}(t) \delta t_f$ plus $\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}} \right)'_{\mathbf{x}^*} \delta \mathbf{x}_f$ and this is evaluated at t_f point similarly $\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}} \right)'_{\mathbf{x}^*} \delta \mathbf{x}_f$ this equal to 0, is my final condition.

(Refer Slide Time: 10:21)

Variational Approach to Optimal Control Systems

In terms of the Lagrangian

$$\left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)_* - \frac{d}{dt} \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)_* = 0$$

$$\left(\frac{\partial \mathcal{L}}{\partial \mathbf{u}}\right)_* = 0$$

$$\left(\frac{\partial \mathcal{L}}{\partial \boldsymbol{\lambda}}\right)_* = 0$$

$$\left[\mathcal{L}^* - \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \dot{\mathbf{x}}(t) \right] \Big|_{t_f} \delta t_f + \left(\frac{\partial \mathcal{L}}{\partial \dot{\mathbf{x}}}\right)'_* \Big|_{t_f} \delta \mathbf{x}_f = 0.$$

So, with this I have my Lagrangian equation says $\frac{\partial L}{\partial \dot{x}} - \frac{d}{dt} \frac{\partial L}{\partial \dot{x}}$. So, first condition I get as my EL equation, second is $\frac{\partial L}{\partial u} = 0$ my control equation this is my $\frac{\partial L}{\partial \lambda} = 0$ this nothing but give me my $\frac{dL}{d\lambda} = 0$ and this is my final boundary condition. So, these conditions can be used to solve any optimal control problem in which u is not constraint. This can further be simplified if we will define a term called Hamiltonian.

(Refer Slide Time: 11:08)

Variational Approach to Optimal Control Systems

Define the Hamiltonian H^* at the optimal condition as

$$\mathcal{H}^* = V(\mathbf{x}^*(t), \mathbf{u}^*(t), t) + \boldsymbol{\lambda}'(t) \mathbf{f}(\mathbf{x}^*(t), \mathbf{u}^*(t), t)$$

where, $\mathcal{H}^* = \mathcal{H}^*(\mathbf{x}^*(t), \mathbf{u}^*(t), \boldsymbol{\lambda}^*(t), t).$

The Lagrangian is

$$\begin{aligned} \mathcal{L} &= \mathcal{L}(\mathbf{x}^*(t), \dot{\mathbf{x}}^*(t), \mathbf{u}^*(t), \boldsymbol{\lambda}(t), t) \\ &= V(\mathbf{x}^*(t), \mathbf{u}^*(t), t) + \left(\frac{\partial S}{\partial \mathbf{x}}\right)'_* \dot{\mathbf{x}}^*(t) + \frac{\partial S}{\partial t} \\ &\quad + \boldsymbol{\lambda}'(t) \{ \mathbf{f}(\mathbf{x}^*(t), \mathbf{u}^*(t), t) - \dot{\mathbf{x}}^*(t) \} \end{aligned}$$

Hamiltonian is defined simply as my V plus lambda prime f, here V is the integrant of my performance index while f is nothing but my state equation. So, what actually we have considered.

(Refer Slide Time: 11:38)

The image shows a handwritten derivation of the Hamiltonian function H. It starts with the Performance Index (PI) defined as $J = S(\cdot) + \int V(\cdot) dt$. The system is given by $\dot{x}(t) = f(\cdot)$ with boundary conditions $x(t_0) = x_0$ and $x(t_f) = x_f$. The Hamiltonian is then defined as $H = V(\cdot) + \lambda' f(\cdot)$. This is further expanded to $H = V(\cdot) + [\lambda_1 \lambda_2 \dots \lambda_n] \begin{bmatrix} f_1(\cdot) \\ f_2(\cdot) \\ \vdots \\ f_n(\cdot) \end{bmatrix}$. Finally, the Hamiltonian is written as a function of state x , control u , costate λ , and time t : $H = H(x, u, \lambda, t)$.

So, from my J which we have defined as the terminal cost plus integral of V dt this was my PI and my system was $\dot{x} = f$ which is $\dot{x} = f(x, u, t)$. In this I am defining my Hamiltonian simply as V plus lambda prime f, because x is the n number of by states. So, I have x_1 as, $\dot{x}_1 = f_1$, $\dot{x}_2 = f_2$. So, anyway my Hamiltonian simply is defined as lambda prime we are writing as $\lambda_1, \lambda_2, \dots, \lambda_n$; f_1, f_2, \dots, f_n .

So, whatever is my system that I am taking as a condition my condition in case of Lagrangian we have taken the $\dot{x} - f = 0$ which I am representing as the g equal to 0. So, this was condition in case of the Lagrangian, but in defining the H we take this f along with the V represented in this way. So, Hamiltonian H can be written as has a function of x u lambda t. So, we are defining our H as V plus lambda prime f where H is a function of x u lambda n t, we already have define our Lagrangian as V plus del S by del x, $\dot{x} - f$ plus del S by del t which is nothing but my, integral inside the integral cost function plus lambda prime and this representing my g.

(Refer Slide Time: 14:38)

Variational Approach to Optimal Control Systems

The Lagrangian in terms of the Hamiltonian becomes

$$\begin{aligned}\mathcal{L}^* &= \mathcal{L}^*(\mathbf{x}^*(t), \dot{\mathbf{x}}^*(t), \mathbf{u}^*(t), \lambda^*(t), t) \\ &= \mathcal{H}^*(\mathbf{x}^*(t), \mathbf{u}^*(t), \lambda^*(t), t) \\ &\quad + \left(\frac{\partial S}{\partial \mathbf{x}}\right)' \dot{\mathbf{x}}^*(t) + \left(\frac{\partial S}{\partial t}\right) - \lambda^{*\prime}(t)\dot{\mathbf{x}}^*(t)\end{aligned}$$

IIT ROORKEE | NPTEL ONLINE CERTIFICATION COURSE

So, what we can do? We can define our L in terms of the H. So, in terms of Hamiltonian if I will define my Lagrangian which is nothing but H which will include V plus lambda prime f and what is rest left del S by del x x dot del S by del t minus lambda prime x dot t. So, H defining is my V plus lambda prime f plus these three terms are left out from this - number 1, number 2 and the third is x dot multiplied with lambda prime. So, we can define my L in terms of H, now, all the four equation which we have seen here, now these equations can be converted into the Hamiltonian form, so that we will see how we can do this.

(Refer Slide Time: 15:46)

$$\begin{aligned}\mathcal{L}(t) &= \mathcal{H}(x, u, \lambda, t) + \left(\frac{\partial S}{\partial x}\right)' \dot{x}(t) \\ &\quad + \left(\frac{\partial S}{\partial t}\right) - \lambda' \dot{x}(t)\end{aligned}$$
$$\frac{\partial \mathcal{L}}{\partial u} = 0 \Rightarrow \frac{\partial \mathcal{H}(t)}{\partial u} = 0 \rightarrow u^{*(t)} = \dots$$

Let us write it on the board what actually is my L in terms of the H see what we are defining L has my H which is a function of x u lambda t plus my term with del S by del x prime d dot t plus del S by del t and minus lambda prime x dot of t. So, this is my L. Now if we will see what is my first equation, for u t that was for optimal control I have my question as del L by del u equal to 0.

(Refer Slide Time: 16:50)

Variational Approach to Optimal Control Systems

The optimal control $u^*(t)$

$$\left(\frac{\partial \mathcal{L}}{\partial \mathbf{u}}\right)_* = 0 \quad \text{or} \quad \left(\frac{\partial \mathcal{H}}{\partial \mathbf{u}}\right)_* = 0$$

The EL Equation

$$\left(\frac{\partial \mathcal{L}}{\partial \mathbf{x}}\right)_* - \frac{d}{dt} \left(\frac{\partial \mathcal{L}^*}{\partial \dot{\mathbf{x}}}\right)_* = 0$$

Leading to costate equation

$$\left(\frac{\partial \mathcal{H}}{\partial \mathbf{x}}\right)_* = -\dot{\lambda}^*(t)$$

So, my first equation is del L by del u equal to 0, if I will use L as H plus del S by del x x dot del S by del t minus lambda prime x dot t. If we will see only H is a function of u this is independent of u, this term is independent of u, this term is independent of u. So, this nothing but give me del H by del u. So, del L by del u I can later write as del H by del u which is nothing but equal to 0. So, if I will take del H by del u equal to 0 this will give me the control. So, solution of this will give me the u star t whatever be the value I will get.

Then we have the EL equation which is defined as, this we will left out as such this is this was my del S by x dot of t and this was my sorry minus what actually we have lambda prime x dot of t.

(Refer Slide Time: 18:21)

$$\begin{aligned}
 \mathcal{L}(t) &= H(x, u, \lambda, t) + \left(\frac{\partial S}{\partial x}\right)' \dot{x}(t) \\
 &\quad + \left(\frac{\partial S}{\partial t}\right)' - \lambda' \dot{x}(t) \\
 \left(\frac{\partial \mathcal{L}}{\partial x}\right)' - \frac{d}{dt} \left(\frac{\partial \mathcal{L}}{\partial \dot{x}}\right) &= 0 \\
 \left(\frac{\partial H}{\partial x}\right)' + \left(\frac{\partial^2 S}{\partial x^2}\right)' \dot{x}(t) + \left(\frac{\partial^2 S}{\partial x \partial t}\right)' - \frac{d}{dt} \left\{ \left(\frac{\partial S}{\partial x}\right)' - \lambda'(t) \right\} &= 0 \\
 \left(\frac{\partial H}{\partial x}\right)' + \left(\frac{\partial^2 S}{\partial x^2}\right)' \dot{x}(t) + \left(\frac{\partial^2 S}{\partial x \partial t}\right)' - \left\{ \left(\frac{\partial^2 S}{\partial x^2}\right)' \dot{x}(t) + \frac{\partial^2 S}{\partial x \partial t} - \lambda'(t) \right\} &= 0 \\
 \left(\frac{\partial H}{\partial x}\right)' + \lambda'(t) &= 0
 \end{aligned}$$

So, this was my L and I have my EL equation as del L by del x minus d by dt of del L by del x dot that is equal to 0. So, if I will take del L by del x this is. So, del H by del x if I will use this plus del 2 S by del x square x dot of t plus del 2 S by del x del t prime minus d by dt del S by del x prime minus lambda star t and this is equal to 0. Say what we are doing? We are taking del L by del x. So, with respect to x I have to differentiate all this term. H is a function of x, so directly we will have del H by del x, del S by del x is also function of x. So, this is del 2 S by del x square x dot of t and x dot if we will say. So, del 2 S by del x del t. So, my first term will give me the first three terms then d by dt of del L by del x dot H is not a function of x dot H is dot a function of x dot, I have a function of x dot as del S by del x prime and another function of x dot is lambda prime x, so minus lambda prime equal to 0.

So, this equation if I will further explain this part d by dt of this what actually we will get. So, I have this term as H del H by del x plus del 2 S by del x square prime x dot of t plus del 2 S by del x del t minus d by dt of del S by del x what actually we will get del 2 S by del x square x dot of t plus del 2 S by del x del t minus lambda dot of t that all equal to 0. Now if you will explain this my this term will cancel out, this time will cancel out and I will left only with del H by del x plus lambda dot of t equal to 0 and this will nothing but leads, so if I will expand my this EL equation in terms of the Lagrangian and Lagrangian I will use it in terms of the Hamiltonian.

So, this equation finally, leads to $\frac{\partial H}{\partial x}$ equal to $-\lambda \dot{x}$ and here this is known as by costate equation. So, my first equation was the $\frac{\partial L}{\partial u}$ equal to 0 which leads to $\frac{\partial H}{\partial u}$ equal to 0. Second equation the EL equation, $\frac{\partial L}{\partial x} - \frac{d}{dt} \frac{\partial L}{\partial \dot{x}}$ equal to 0, this will leads to $\frac{\partial H}{\partial x}$ equal to $-\lambda \dot{x}$. So, in this four equation, these 2 we have seen $\frac{\partial L}{\partial \lambda}$ is 0, from $\frac{\partial L}{\partial \lambda}$ my H is a function of λ and this \dot{x} is also a function of λ .

(Refer Slide Time: 24:38)

$$\begin{aligned} \mathcal{L}(\lambda) &= H(x, u, \lambda, t) + \left(\frac{\partial S}{\partial x}\right)' \dot{x}^{(t)} \\ &\quad + \left(\frac{\partial S}{\partial t}\right) - \lambda' \dot{x}^{(t)} \\ \frac{\partial \mathcal{L}(\lambda)}{\partial \lambda} = 0 &\Rightarrow \frac{\partial H(\lambda)}{\partial \lambda} - \dot{x}^{(t)} = 0 \\ \frac{\partial H(\lambda)}{\partial \lambda} &= \dot{x}^{(t)} \end{aligned}$$

So, now we are seeing the third equation $\frac{\partial L}{\partial \lambda}$ equal to 0, $\frac{\partial L}{\partial \lambda}$ equal to 0, this will leads to what? The first H is a function of λ $\frac{\partial H}{\partial \lambda}$ and last term minus $H \dot{t}$ that is equal to 0.

So this simply give me $\frac{\partial H}{\partial \lambda}$ equal to \dot{x} and similarly we can place the value of the L in the terminal condition. So, $\frac{\partial L}{\partial \lambda}$ leads to this and once we will place the H into my terminal condition sorry L in the terminal condition I get H plus $\frac{\partial S}{\partial t} \Delta t - \frac{\partial S}{\partial x} \dot{x} \Delta x$ equal to 0 this will be my final condition.

Variational Approach to Optimal Control Systems

As $\left(\frac{\partial \mathcal{L}}{\partial \lambda}\right)_* = 0$

Leads to State Equation $\left(\frac{\partial \mathcal{H}}{\partial \lambda}\right)_* = \dot{\mathbf{x}}^*(t)$

the boundary condition at the optimal point

$$\left[\mathcal{H}^* + \frac{\partial S}{\partial t}\right]_{t_f} \delta t_f + \left[\left(\frac{\partial S}{\partial \mathbf{x}}\right)_* - \lambda^*(t)\right]'_{t_f} \delta \mathbf{x}_f = 0$$

So, in terms of Hamiltonian my equations are del H by del u equal to 0, del H by del lambda equal to x dot which is called my state equation, del H by del x equal to minus lambda dot called my costate equation and boundary condition as given by H plus del S by del t delta t f, del S by del x minus lambda t delta x f that equal to 0.

Variational Approach to Optimal Control Systems

In terms of Hamiltonian H^*

The Control Equation $\left(\frac{\partial \mathcal{H}}{\partial \mathbf{u}}\right)_* = 0$

The State Equation $\left(\frac{\partial \mathcal{H}}{\partial \lambda}\right)_* = \dot{\mathbf{x}}^*(t)$

The Costate Equation $\left(\frac{\partial \mathcal{H}}{\partial \mathbf{x}}\right)_* = -\dot{\lambda}^*(t)$

The Boundary Condition $\left[\mathcal{H}^* + \frac{\partial S}{\partial t}\right]_{t_f} \delta t_f + \left[\left(\frac{\partial S}{\partial \mathbf{x}}\right)_* - \lambda^*(t)\right]'_{t_f} \delta \mathbf{x}_f = 0$

So, four equations in Lagrangian given here can be transformed in terms of the Hamiltonian as these four equations. So, our approach normally here is for a given system we define the H find del H by del u equating to 0 give me the optimal control, I

take $\frac{\partial H}{\partial \lambda}$, so I will have my state equation; $\frac{\partial H}{\partial x}$ I will have my costate equation and these equations can simultaneously be solved using the final boundary condition.

So, what is the final boundary condition? As in this case we have assumed my boundary conditions to be initial point is fixed, but the endpoint is free. So, we have taken a journal case. So, we can have the different type of the system based on my terminal condition, these cases we can consider it as number one we have the fixed final time and the fixed final state. So, these are the equations which can simultaneously be solved to find out to find the optimal control for a given plant which is minimizing a given performance index. Based on the terminal condition we have the different cases in which my final condition is changing according to the $x(t_f)$ and the t_f condition. So, these cases we will take up in the next class. So, this class we ending here.

Thank you very much.
