

# Mathematics in India: From Vedic Period to Modern Times

Prof. M. D. Srinivas

Department of Mathematics

Indian Institute of Technology – Bombay

## Lecture - 40

### Mathematics in Modern India 2

So this lecture, we will continue with the story of Mathematics in modern India. So I will start with the continuation of how our Indian scholars started rediscovery our tradition of mathematics and astronomy. I will recount the names of some of the most important people then modern international scholarship on Indian mathematics and astronomy also in summary.

**(Refer Slide Time: 00:38)**

After that we will briefly discuss development of higher education research in India in the first half of 20<sup>th</sup> century. Then more importantly we will summarize some of the highlights in the development of modern mathematics in India in the last 100 years. Mostly, I will be able to give only the names of concerns rather than details of the work. So in Ramanujan's case I could summarize half a dozen researches by him even that will not be possible.

First of all, I am not technically adequately competent to do that sort of a thing also these are lot of highly technical work done by mathematicians. Finally, I would like to make an assessment of development of higher education, scientific research and mathematics in modern India in the world context. Where does India stand in the world of science and mathematics we would like to know where are we going? Where do we stand?

(Refer Slide Time: 01:33)

**Rediscovering the Tradition (1900-1950)**

Several important texts of Indian mathematics and astronomy were published in the period 1900-1950.

Harilal Dhruva published the *Rekhaganita*, translation of Euclid from Tusi's Persian version (Bombay 1901).

Vindhyesvari Prasad Dvivedi published some of the ancient *siddhantas* in *Jyotīśasiddhānta-saṅgraha* (Benares 1912).

Babuaji Misra edited the *Khaṇḍakhādya* of Brahmagupta with Āmarja's commentary (Calcutta 1925) and *Siddhāntaśekhara* of Śrīpati with Makkibhaṭṭa's commentary (Calcutta 1932, 47).

Gopinatha Kaviraja edited the *Siddhāntasārvabhauma* of Muniśvara, 2 Vols. (Benares 1933, 3); 3rd Vol. Ed. by Mithalal Ojha (Benres 1978)

Kapadia edited the *Gaṇitatilaka* of Śrīdhara with commentary (Gaekwad Oriental Series 1935)

So, this will be the outline of today's talk. So this study of Indian tradition continued with people like Vindhyesvari Prasad Dvivedi, Babuaji Misra, Gopinatha Kaviraja, Kapadia.

(Refer Slide Time: 01:43)

**Rediscovering the Tradition (1900-1950)**

Several important works were published from the Ānandāśrama Pune: *Karaṇakaustubha* of Kṛṣṇa Daivajña (1927), *Lilāvati* with commentaries of Gaṇeśa Daivajña and Mahidhara (1937), *Bījagaṇita* with Kṛṣṇa Daivajña's commentary (1930), *Siddhāntaśiromaṇi Gaṇitādhyāya*, with commentary of Gaṇeśa (1939, 41), *Kuṭṭakāraśiromaṇi* of Devarāja (1944), *Mahābhāskariya* with Parameśvara's commentary (1945), *Laghubhāskariya* with Parameśvara's commentary (1946), *Laghumānasa* with Parameśvara's commentary (1952). *Siddhāntaśiromaṇi, Golādhyāya*, with Muniśvara's commentary (1943, 52).

Several important works of Kerala School were published from Tiruvananthapuram: *Golādīpikā* of Parameśvara, ed. by T. Ganapati Sastri (1916), *Āryabhaṭīyabhāṣya* of Nilakaṇṭha in 3 Volumes, ed. by K. Sambasiva Sastry and S. Kunjan Pillai (1930, 31, 57), *Karaṇapaddhati* of Putumana Somayāji, ed. by K. Sambasiva Sastri (1937), *Tantrasaṅgraha* of Nilakaṇṭha with *Laghuviṛṭi* of Śaṅkara ed. by S. Kunjan Pillai (1957).

More interestingly, the Anandasram series in Pune came up with editions on many of them. Many of them we are using in our course like Mahabhaskariya, Laghubhaskariya, Laghumanasa. Similarly, from Kerala also some of the important Kerala School were started getting published. Aryabhatiyabhāṣya Nilakantha was published in 3 volumes. The Tantrasaṅgraha was published around 1950's. Karanapaddhati of Puthumana Somayaji got published.

(Refer Slide Time: 02:10)

## Rediscovering the Tradition (1900-1950)

**Malur Rangacharya** (1861-1916), a science graduate from Madras Christian College who later became Professor of Sanskrit at Presidency College, edited *Gaṇitasāraṅgraha* of Mahāvīra along with English translation and notes (Madras 1912). This was the first detailed exposition of an Indian mathematical work after Colebrooke's translation of Brahmagupta and Bhāskara in 1817.

**Prabodh Chandra Sengupta** (1876-1962), a Professor of Mathematics at Bethune College, Calcutta, published several technical articles on Indian mathematics and astronomy highlighting the distinct nature of Indian methods as compared with the Greek methods. He published a translation of *Āryabhaṭīya* (1927) and a translation of *Khaṇḍakhādyaka* with detailed notes and examples (Calcutta 1934). Later, he also edited *Khaṇḍakhādyaka* with Pṛthūdaka's Commentary (Calcutta 1941). He also wrote on *Ancient Indian Chronology* (1947)

Malur Rangacharya translated, edited and translated the *Gaṇitasāraṅgraha* about 100 years ago. He was a professor in Chennai. P. C. Sengupta was a great scholar who edited and translated *Khaṇḍakhādyaka*.

(Refer Slide Time: 02:27)

## Rediscovering the Tradition (1900-1950)

**Attippattu A. Krishnaswami Ayyangar** (1892-1953) was educated at Pachaiyappa college, Madras, and later worked as a Professor of Mathematics at Maharaja's College, Mysore. He published several articles bringing out many of the technical aspects of Indian Mathematical tradition. In a series of articles (1929-1942), he showed that the *Cakravāla* process always leads to a solution of the *Vargaprakṛti* equation and also that *Cakravāla* in fact corresponds to a semi-regular continued fraction expansion which is a contraction of the simple continued fraction associated with the Euler-Lagrange method of solution.

**Bibhutibhusan Datta** (1888-1958) passed MSc in Mixed Mathematics in 1914, and was awarded a research scholarship at Calcutta University. However, right from an young age, Datta had an inclination for *Sanyāsa*, the life of renunciation. He was initiated by Swami Vishnu Tirtha Maharaja in 1920. After receiving the DSC degree of Calcutta University for his thesis on hydrodynamics in 1921, Datta became interested in History of Mathematics under the influence of Prof. Ganesh Prasad.

I have already spoken about A. A. Krishnaswami Ayyangar on *Cakravāla*. Bibhutibhusan Datta is a great name. He first did a DSC in hydrodynamics in 1921. But from his young age he had an inclination for *Sanyasa*. He became interested in history of mathematics under the influence of Professor Ganesh Prasad.

(Refer Slide Time: 02:47)

### Rediscovering the Tradition (1900-1950)

During the period 1926-35, Datta published over fifty papers on various aspects of Indian Mathematics. He also collected and studied a large number of manuscripts. All of this led to the preparation of the monumental *History of Hindu Mathematics*.

Datta resigned from Professorship of Calcutta University in 1929, "in aspiration of the life of a Vedantist residing in the Brahman, the Infinite Self", as he mentioned in a letter to Prof. Karpinsky in 1934. In 1931, he briefly returned to the University and, in deference to the wishes of Prof. Ganesh Prasad, delivered a series of lectures which were published as *The Science of Sulba* (1932). In 1933, he retired from the University and in 1938 took up *Sanyāsa* and became Swami Vidyananya. He spent most of his later life at Pushkara in Rajasthan. In this period he wrote several scholarly volumes in Bengali on Indian Philosophy. It is said that, prior to leaving the University in 1929, Datta handed over the manuscript of the book *History of Hindu Mathematics: A Source Book*, to his junior colleague Avadhesh Narayan Singh. The latter saw through the publication of two volumes (Arithmetic and Algebra) in 1935 and 1938.

So, during the 8 years 1926 to 1935 Datta published over 50 papers on various aspects of Indian mathematics and he collected lot of manuscripts and this constituted the great magnum opus history of Hindu mathematics which was published in 2 volumes. Soon enough Datta left the university and he took up Sanyasa he has written a huge number of books on Vedanta in Bengali.

(Refer Slide Time: 03:23)

### Rediscovering the Tradition (1900-1950)

**Avadhesh Narayan Singh** (1901-1954) went on to initiate the study of Indian mathematics at Lucknow University. He died in 1954 without completing the publication of the third volume of the Datta and Singh *magnum opus*, which was to cover the history of 'geometry, trigonometry, calculus and various other topics such as magic squares, theory of series and permutations and combinations' as noted in the preface of the first volume.

The third volume was not included even when the book was reprinted in 1961. It seems that, prior to his death in 1958, Swami Vidyananya gave the manuscript of the third volume to Kripa Shankar Shukla. A copy was also obtained by R. C. Gupta in 1979 from S. N. Singh, the son of A. N. Singh. Shukla later published a revised version of the third volume in the form of a series of seven articles in the Indian Journal of History of Science during 1980-1994.

**Ramavarma Maru Thampuran** published, in collaboration with Akhileswarayyar, the Mathematics section of *Yuktibhāṣā* (in Malayalam) of Jyēṣṭhadeva, along with detailed mathematical notes in Malayalam (Trichur 1948). This formed the basis of all later work on *Yuktibhāṣā*.

Afterwards he handed over this manuscript of the History of Hindu mathematics to his junior colleague Avadhesh Narayan Singh. Avadhesh Narayan Singh started this group on Indian Mathematics in Lucknow. He was a professor in Lucknow. He got the 2 volumes published 1935 and 1938.

But there was a third volume the manuscript of which existed which was supposed to contain geometry, trigonometry, calculus and various other topics such as magic squares, theory of series, permutations and combinations. This did not get published. Even when the book was reprinted from Bombay in 1961 this was not published. Later on due to the effort of R. C. Gupta and K. Shukla this appeared as a series of articles in the Indian Journal of history of Science.

Ramavarma Maru Thampuram from a royal family in Kerala edited the mathematics part of Yuktibhasa in 1948 with copious Malayalam notes and in fact this was the basis for all the works on Yuktibhasa by Professor Rajagopal and others.

**(Refer Slide Time: 04:21)**

### Rediscovering the Tradition (1950-2010)

**Indian National Commission for History of Science** was constituted by the Indian National Science Academy in 1965. The Commission actively promotes research on History of Science in India.

In 1971, the Academy published *A Concise History of Science in India* (1971), a landmark publication in the field, edited by D. M. Bose, S. N. Sen and B. V. Subbarayappa. In 2009, Subbarayappa brought out a revised edition with substantial additions.

In 1966, the Academy started the *Indian Journal of History of Science*, which has been very successful and is counted amongst the premier Journals of India.

**Cadambattur Tiruvenkatacharlu Rajagopal** (1903-1978) taught in Madras Christian College, and later joined the Ramanujan Institute in 1951. He worked on series and summability. In series of seminal papers, published from around 1944 onwards, Rajagopal and his students, K. Mukunda Marar, A. Venkataraman, T. V. Vedomurthi Aiyar and M. S. Rangachari, brought to light, for the first time, the full technical details of the proofs contained in *Yuktibhāṣā* and other seminal works of the Kerala School.

So, this was the pre-independence period. In the post-independence period the major effort to study Indian mathematics and astronomy, the main promoter of such study is what is called Indian National Commission for History of Science established under the Indian National Science Academy in 1965. In 1971 they came up with a landmark publication called *A Concise History of Science in India*.

Which even today remains the only available book summarizing evolution of science in India, edited by Bose, Sen and Subbarayappa. Subbarayappa brought out a revised edition now published by the universities press. The academy started the journal, *Indian Journal of History of Science*, which is the leading journal in which technical articles on History of Science in India are published.

And mathematics and astronomy do take a prima place there may be about 30% of the articles or even 50% would be in mathematics and astronomy. C. T. Rajagopal, I already mentioned his work on infinite series in Kerala mathematics.

(Refer Slide Time: 05:27)

**Rediscovering the Tradition (1950-2010)**

**Chickamagalur Narayana Iyengar Srinivasa Iyengar** (1901-1972) obtained MSc at Calcutta and taught at Mysore, Bangalore and Dharwar. His research on differential equations earned him a DSc in 1932 from Calcutta University. Keenly interested in the history of mathematics, he published the *Gayitāsāstrada-caritre* in Kannada (1958), and the *History of Ancient Indian Mathematics* in 1967. He supervised the thesis of Dhulipala Arka Somayaji on *A critical Study of Ancient Indian Astronomy* in 1971. Somayaji later published a translation of *Grahagaṇita* portion of *Siddhāntaśiromaṇi* along with mathematical notes.

**Tekkath Amayankoth Kalam Saraswati Amma** (1918-2000) worked with V. Raghavan in Madras University and then taught at Ranchi and Dhanbad. Her thesis work led to the publication of the first authentic and comprehensive study of *Geometry in Ancient and Medieval India* (1979). She supervised the thesis of R. C. Gupta on *Trigonometry in Ancient and Medieval India*.

C. N. Srinivasa Iyengar, his book on History of Ancient Indian Mathematics in 1967 is a beautiful short book which all students can read and understand. He in fact, directed a thesis on Indian Astronomy also by Somayaji which is also a very beautiful work publish from Karnataka university. Saraswati Amma was a Sanskrit scholar who went to Professor Raghavan and said I want to do PhD.

And he asked her you have a BSc degree why do not you work on something different than Kavya or Alankara or Vyakarana. Why do not you do some work on mathematics and that work became a very nice work and ultimately resulted in this really first comprehensive study of geometry in ancient and medieval India in 1979. Saraswati Amma also guided R. C. Gupta in his thesis on trigonometry.

(Refer Slide Time: 06:19)

## Rediscovering the Tradition (1950-2010)

**Samarendra Nath Sen** (1918-1992) was a graduate in Physics and served as Registrar of Indian Association for Cultivation of Science. During 1947-49 he was with UNESCO and came under the influence of Joseph Needham. In 1950s He wrote a two volume *Vijñāner Itihāsa* in Bengali. Sen was an active member of the INSA Commission on History of Science.

In 1966 Sen brought out *A Bibliography of Sanskrit Works in Astronomy and Mathematics* (with assistance from A. K. Bag and S. R. Sarma). Sen and Bag published a translation of the *Śulvasūtras* in 1983. Sen also edited, with K. S. Shukla, a volume on the *History of Astronomy in India* (1985).

S. N. Sen was in the Indian Association of Cultivation of Science. He came under the influence of Needham when he was in UNESCO and he was associated with the Indian National Science Commission and he has edited and published several books.

**(Refer Slide Time: 06:33)**

## Rediscovering the Tradition (1950-2010)

**Kripa Shankar Shukla** (1918-2009) obtained his MSc from Allahabad University, and joined the Department of Mathematics Lucknow University. In 1955, he obtained his PhD degree under the supervision of A. N. Singh, for his thesis on *Bhāskara I and His Works*. This led to his landmark editions and translations of *Mahābhāskarīya* (1960) and *Laghubhāskarīya* (1963), and edition of *Āryabhaṭīyabhāṣya* (1976) of Bhāskara I.

Shukla has brought out editions (and translations) of several other seminal texts such as *Sūryasiddhānta* with Parameśvara's commentary (1957), *Pāṭīganīta* (1959), *Dhikojīdākaraṇa* (1969), *Bījaganītāvataṃsa* (1970), *Āryabhaṭīya* (with K. V. Sarma in 1976), *Karaṇaratna* (1979), *Vaṭeśvara-siddhānta* in two volumes (1985,86), and *Laghumānasa* (1990).

Shukla also edited the *History of Astronomy in India* with S. N. Sen (1985). During 1980-1994, he also edited and published, as a series of articles, the various chapters of the unpublished third volume of Datta and Singh's *History of Hindu Mathematics*.

Kripa Shankar Shukla is one of the most important scholars of Indian Astronomy and Mathematics in the second half of last century. He has edited and translated several works especially the works of Bhaskara, Mahabhaskariya, Laghubhaskariya, Aryabhatiyabhasya but also Vatesvara-siddhanta, Laghumanasa and he is one of the and he also published the third volume of the Datta and Singh in the forum of a collection of articles.

**(Refer Slide Time: 07:03)**

## Rediscovering the Tradition (1950-2010)

**Krishna Venkatesvara Sarma** (1919-2005) did his MA in Sanskrit in Trivandrum, and later joined the *New Catalogus Catalogorum* Project with V. Raghavan at Madras University. Soon he embarked on his life-long pre-occupation with Kerala Astronomy and edited the important works *Grahaçārūnibandhana* of Haridatta, *Siddhāntadarpaṇa* of Nilakaṇṭha, *Veṅvāroha* of Mādha and *Goladīpikā* of Parameśvara. During this period, Sarma worked with the renowned scholar T. S. Kuppanna Sastri, in the edition of *Vākyakarāṇa* (1962).

Sarma shifted to the Visvesvaranand Institute at Hoshirapur, where he served as director during 1975-80. During this period, he published more than 50 books, including several important works such as *Dṛggaṇita* of Parameśvara, *Golasāra* of Nilakaṇṭha, *A History of the Kerala School of Hindu Astronomy*, *Līlāvati* of Bhāskarācārya with *Kriyākramakārī* of Śaṅkara, *Tantrasaṅgraha* of Nilakaṇṭha with *Yuktīdīpikā* of Śaṅkara, *Jyotirmīmāṃsā* of Nilakaṇṭha and *Gaṇita-yuktayaḥ*.

Other great name in History of Astronomy and mathematics or in the study of Indian Mathematics and Astronomy in the second half of last century is of Professor K.V. Sarma from Chennai. He was with the new Catalogus Catalogorum and at that time itself he got interested in the works of Kerala school and published the Goladipika, Venvaroha and Siddhantadarpana.

He worked with Professor Kuppanna Sastri on Vakyakarana. Then he shifted to Hoshirapur. There he really published over 50 works which have really brought to light the entirety of the Kerala School of Mathematics and Astronomy Drgganita, Golasara, Kriyakramakari, Tantrasangraha with Yukidipika, Jyotirmimamsa of Nilakantha and his last was the magnum opus Ganitha Yuktibhasa and its English translation which got published in 2008.

**(Refer Slide Time: 07:48)**

## Rediscovering the Tradition (1950-2010)

In 1983 Sarma returned to Madras, and continued his work actively till his very death in 2005. His important publications during this period include: *Indian Astronomy: A Source Book* with B. V. Subbarayappa (1985); *Pañcasiddhāntikā* of Varāhamihira, based on his work with T. S. Kuppanna Sastri (1993); and his *magnum opus*, the edition and translation of *Yuktibhāṣā*, which appeared in 2008, along with notes by K. Ramasubramanian, M. S. Sriram and M. D. Srinivas.

**Radha Charan Gupta** (b.1935) studied in Lucknow University and did his PhD with Saraswathi Amma at Ranchi. He served as Professor of Mathematics at the Birla Institute of Technology, Ranchi. With his extraordinary passion for history of mathematics, Gupta has investigated almost all aspects of Indian mathematics. He has published nearly 500 papers on history of mathematics. He founded the Journal *Gaṇita Bhāratī* in 1979, which has played a major role in promoting research on history of mathematics in India. Gupta was awarded the prestigious K. O. May Prize in the History of Mathematics in 2009.

R. C. Gupta was a student of Saraswathi Amma in Ranchi and he started the journal *Ganita Bharati* in 1979 which is really one of the important professional journals devoted to History of Mathematics in India. Gupta himself has authored more than 500 papers on various aspects of History of Mathematics in India and the world. He was awarded the K. O. May Prize in 2009.

(Refer Slide Time: 08:24)

### Rediscovering the Tradition (1950-2010)

**Amulya Kumar Bag** (b.1937) worked with S. N. Sen from the time of inception of the INSA Commission. He has also been associated with the *Indian Journal of History of Science* all through and has contributed significantly to the Journal's success. Bag has published an overview of *Mathematics in Ancient and Medieval India* (Benares 1981) and has also translated *Śulvasūtras* with S. N. Sen.

**George Gheverghese Joseph** was born in Kerala, but spent much of childhood in Africa and later shifted to England. He has been in the forefront of the debate against Euro-centrism in the history mathematics. His book *The Crest of the Peacock: Non-European Roots of Mathematics*, first published in 1991, drew wide acclaim and was translated to several languages. The third edition has appeared in 2011. Recently, Joseph has also written *A Passage to Infinity: Medieval Indian Mathematics from Kerala and its Impact* (2009).

A. K. Bag has been running the *Indian Journal of History of Science* as its editor for the past 30-40 years. George Joseph many of you would have seen his book *The Crest of the Peacock: Non-European Roots of Mathematics* whose third edition has come is being translated into several languages. He has been in the forefront of the debate against Euro-centrism in the history of mathematics.

(Refer Slide Time: 08:46)

### Rediscovering the Tradition (1950-2010)

Among the prominent mathematicians associated with the Tata Institute of Fundamental Research, Koppambil Balagangadharan (1922-2012), Ramiengar Sridharan (b.1935) and Shrikrishna Gopalrao Dani (b.1947) have done significant work also on Indian mathematical tradition.

Balagangadharan has analysed the work of Kerala School on infinite series; Sridharan has studied the Indian work on algebra and the combinatorial techniques developed in the Indian texts on prosody and music. Dani has investigated the geometrical and algebraic techniques in *Śulvasūtra*-s.

P. P. Divakaran (b.1936) of the School of Physics TIFR has been working on various conceptual issues relating to development of calculus in the work of the Kerala mathematicians.

Recently, of course several scholars in Tata Institute like Professor Balagangadharan, Sridharan, Dani, etc. Prof. Divakaran have also done interesting work, I mean they are professional mathematicians and have done interesting work on Indian and tradition of mathematics.

(Refer Slide Time: 09:03)

### Rediscovering the Tradition (1950-2010)

Recently, there have been many important books published on Indian Mathematics and astronomy. They include:

- ▶ The translations of *Grahalāghava* (2006) and *Karaṇakutūhala* (2008) with notes by S. Balachandra Rao and S. K. Uma
- ▶ C. K. Raju, *The Cultural Foundations of Mathematics* (2007)
- ▶ H. Selin and R. Narasimha (ed), *Encyclopaedia of Classical Indian Sciences* (2007)
- ▶ B. V. Subbarayappa, *The Tradition of Astronomy in India* (2008)
- ▶ S. R. Sarma, *The Archaic and the Exotic: Studies in the History of Indian Astronomical Instruments* (2008)
- ▶ J. V. Narlikar (ed), *Science in India* (2009)
- ▶ C. S. Seshadri (ed), *Studies in the History of Mathematics* (2010)
- ▶ *Tantrasaṅgraha*, Translated with Explanatory Notes by K. Ramasubramanian and M. S. Sriram (2011).
- ▶ T. K. Puttaswamy, *Mathematical Achievements of Pre-modern Indian Mathematicians* (2012)

And here are some of the books which have appeared on the subject in the last 7-8 years from various Indian Scholars.

(Refer Slide Time: 09:15)

### Modern Scholarship on Indian Mathematics (1900-2010)

**George Rusby Kaye** (1866-1929) was the Principal of Government Training College, Allahabad and a member of Bureau of Education at Simla. He wrote monographs on Indian mathematics, tracing most of it to foreign influences. Some of his books are: *Indian Mathematics* (1915), *The Astronomical Observatories of Jaipur* (1918), *Hindu Astronomy* (1924) and *The Bakhshālī Manuscript* (1927).

A. Burk edited the *Āpastamba Śulvasūtra* with a German translation (1901-2). Walter Eugene Clark, a Professor of Sanskrit at Harvard, translated the *Āryabhaṭīya* (Chicago 1930). J. M. van Gelder edited and translated the *Mānava Śulvasūtra* (1961-3).

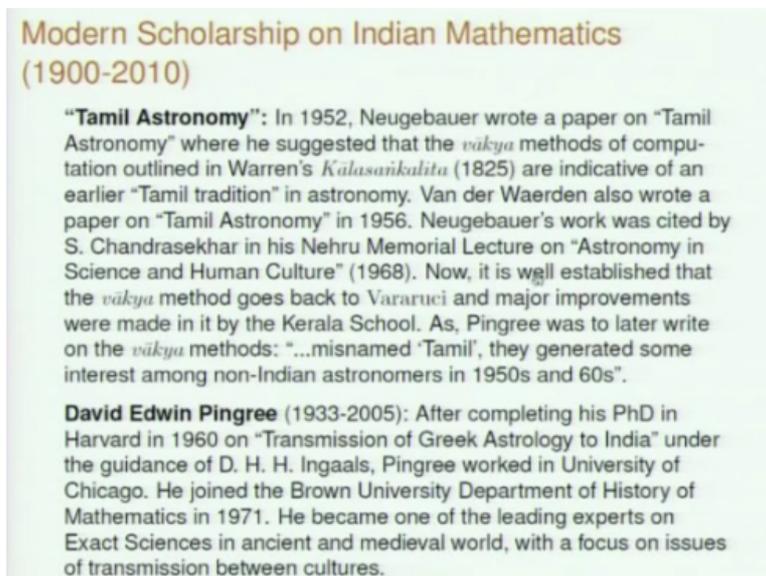

**Otto Edward Neugebauer** (1899-1990) was born in Austria, studied mathematics in Göttingen, and later shifted to the study of Egyptian, Babylonian and Greek exact sciences. In 1939 he moved to the US and founded the History of Mathematics Department at Brown University in 1947. During 1952-67 he published several papers on Indian Astronomy highlighting issues of transmission. He has translated the *Astronomical Tables of al Khwarizmi* (1962) and *Pañcasiddhāntikā* with Pingree (1970).

Now about the modern international scholarship George Kaye was a name came up in the context of Bakhshali Manuscript, I think that he was one of those who was dismissive of the Indian tradition and traced most of it to Greek and other sources. He wrote couple of works in

early part of 20th century. Neugebauer was a major scholar of History of Astronomy and Mathematics.

He was a mathematician trained in Gottingen but then he shifted to United States since founded the famous history of Mathematics Department in the Brown University. He has published huge amount of material on Babylonian, Greek and other civilizations the History of exact sciences. He has produced Pancasiddhantika and the Astronomical Tables of al Khwarizmi which have based upon Indian Astronomy.

**(Refer Slide Time: 10:02)**

**Modern Scholarship on Indian Mathematics (1900-2010)**

**"Tamil Astronomy":** In 1952, Neugebauer wrote a paper on "Tamil Astronomy" where he suggested that the *vākya* methods of computation outlined in Warren's *Kālasāṅkālita* (1825) are indicative of an earlier "Tamil tradition" in astronomy. Van der Waerden also wrote a paper on "Tamil Astronomy" in 1956. Neugebauer's work was cited by S. Chandrasekhar in his Nehru Memorial Lecture on "Astronomy in Science and Human Culture" (1968). Now, it is well established that the *vākya* method goes back to Vararuci and major improvements were made in it by the Kerala School. As, Pingree was to later write on the *vākya* methods: "...misnamed 'Tamil', they generated some interest among non-Indian astronomers in 1950s and 60s".

**David Edwin Pingree (1933-2005):** After completing his PhD in Harvard in 1960 on "Transmission of Greek Astrology to India" under the guidance of D. H. H. Ingalls, Pingree worked in University of Chicago. He joined the Brown University Department of History of Mathematics in 1971. He became one of the leading experts on Exact Sciences in ancient and medieval world, with a focus on issues of transmission between cultures.

Neugebauer wrote a paper on Tamil Astronomy in 1952 where he suggested that the vakya methods which were given in Warren's Kalasankalita are indicative of an entirely different older Indian tradition which he called Tamil tradition. Another great historian and mathematician Van der Waerden joined the Van der Waerden and he also wrote a paper on Tamil Astronomy in 1956.

And they were sort of approvingly cited by our professor S. Chandrasekhar in his famous Nehru Memorial Lecture on Astronomy in Science and Human Culture delivered in Delhi in 1968. Of course now it is well established that the vakya method is goes back to Vararuci and major improvements in it were made by the Kerala School and so today Pingree writes that the vakya methods misnamed Tamil.

They have generated some interest among the non-Indian astronomers in the 1950s and 1960s. David Pingree is one of the most well-known names in the history of astronomy

specializing in Indian Jyotihśāstra astrology also and he focused mainly on the issues of transmission between different cultures. Ingaals later back in Chicago then came to the History of Mathematics Department in Brown.

(Refer Slide Time: 11:27)

### Modern Scholarship on Indian Mathematics (1900-2010)

Pingree has published around 20 books and over 60 articles on all aspects of *Jyotiḥśāstra*, which include editions of *Pañca-siddhāntikā* (with Neugebauer) *Vṛddha-Yavana-jātaka* and *Yavana-jātaka*, and a history of *Jyotiḥśāstra*, apart from the volumes of the seminal *Census of Exact Sciences in Sanskrit*. Many of his students have become leading scholars of Indian mathematics and astronomy.

During the period 1970-95, David Pingree brought out five volumes (running to over 1600 pages) of the *Census*, which lists the works of each author together with detailed references to the available manuscripts as listed in various catalogues. Detailed notices are also given about the publications of these works and secondary studies on them.

He published more than 20 books and several articles edited and translated Pancasiddhantika, Vrddha-Yavanajataka, written history of Jyotihśāstra but his main work is the Census of Exact Sciences of which 5 volumes have appeared. They list alphabetically all the works in Indian mathematics and astronomy along with the detail references to the manuscripts that are available in a different manuscript catalogues as published by the various universities.

They also giving permission on the publications of these works.

### Modern Scholarship on Indian Mathematics (1900-2010)

**French Scholars of Indian Mathematics:** Leon Rodet, studied the Algebra of Al Khwarizimi in relation to Greek and Indian methods (1878). He also translated the *Gaṇitapāda* of *Āryabhaṭīya* (1879). Louis Renou (1896-1966) and Jean Filliozat (1906-1982) were major scholars of Sanskrit Grammar, Philosophy and Sciences.

Roger Billard (1922-2000) wrote *L'Astronomie Indienne* (1971) where he tried to use computational and statistical methods to date the Indian texts.

Recently, Karine Chemla (b.1957) has worked on the inter-relation between Chinese and Indian mathematical methods. Her student, Agathe Keller has published a translation of the *Gaṇitapāda* of *Āryabhaṭīyabhāṣya* of Bhāskara I with detailed notes (2006).

Francois Patte has worked on Bhāskara's *Līlāvati* and *Bījagaṇita* and their commentaries.

French Scholars have also been working systematically on the older said Renou and Filliozat are wrote important papers on Sanskrit Grammar, Philosophy and Sciences. Then Billard wrote on the History of Indian Astronomy and recently an interesting thesis by Agathe Keller translating the Ganitapada of Aryabhatiyabhasya of Bhaskara with detailed notes has appeared.

**(Refer Slide Time: 12:27)**

### Modern Scholarship on Indian Mathematics (1900-2010)

**Japanese Scholars of Indian Mathematics:** Kiyosi Yabuuti (1906-2000), the doyen of Japanese scholars on history of science, had written on the relation between the Chinese text *Chiu-Chih Li* and Indian astronomy in 1963. Micho Yano, Takao Hayashi (b.1949) and Takanori Kusuba (b. 1952) have written several papers on Indian mathematics and astronomy. They have published a book *Studies in Indian Mathematics, Series Pi and Trigonometry* in Japanese (1997) and, along with S. R. Sarma, they have translated *Gaṇitasārakaumudī* of Thakkura Pherū (2011).

Hayashi has edited and translated the *Bakshālī* Manuscript (2005), which was his thesis work supervised by Pingree. He has also edited and translated the *Bījagaṇita* of Bhāskara with *Vāsanā* (2009) and *Kuttākāraśiromaṇi* of Devarāja (2012). Takanori Kusuba and Setsuro Ikeyama were also Pingree's students and have worked on *Gaṇitakaumudī* and *Brāhmasphuṭa-siddhānta*. Yukio Ohashi has worked on Indian astronomical instruments under the guidance of K. S. Shukla.

Interestingly there is school of Japanese Scholars working on Indian Mathematics and Astronomy. Kiyosi Yabuuti was one of the older school who worked on the relation between Indian and Chinese astronomy. Yano, Hayashi and Kusuba whose names we have heard already. They have written a book in Japanese on Indian Mathematics.

They have translated the Ganitasarakaumudi of Thakkura Pheru together with S. R. Sarma the authors in that called Sarma, Kusuba, Hayashi and Yano. Hayashi himself has edited Bakshali Manuscript, Bijaganita, Kuttakarasiromani and Kusuba and Ikeyama have worked on Ganitakaumudi and Brahmasphuṭa-siddhanta. There is one Japanese scholar Ohashi who had with Professor Shukla on astronomical instruments.

## Modern Scholarship on Indian Mathematics (1900-2010)

There have been several important works, which have been published recently, which include significant material on Indian mathematics and astronomy. These include:

- ▶ Helaine Selin (ed), *Encyclopedia of Science Technology and Medicine in Non-Western Cultures* (2008);
- ▶ van Brummelen, *The Mathematics of the Heavens and the Earth* (2009)
- ▶ Kim Plofker, *History of Mathematics in India* (2010);
- ▶ Clemency Montelle, *Chasing Shadows, Mathematics Astronomy and Early History of Eclipse Calculation* (2010).

So, it is a big school compared given the number of people working on this kind of feature. These are some of the international books which have been published on Indian Astronomy and Mathematics in recent times.

**(Refer Slide Time: 13:27)**

## Development of Higher Education in India (1900-1950)

	1901-2	1921-22	1936-37
<b>Universities</b>	5	10	15
Number of Students			9,697
<b>Arts Colleges</b>	145	165	271
Number of Students	17,651	45,418	86,273
<b>Professional Colleges</b>	46	64	75
Number of Students	5,358	13,682	20,645
<b>Secondary Schools</b>	5,493	7,530	13,056
Number of Students	6,22,768	11,06,803	22,87,872
<b>Primary Schools</b>	97,854	155,017	1,92,244
Number of Students	32,04,336	61,09,762	102,24,288
<b>Special Schools</b>	1,084	3,344	5,647
Number of Students	36,380	120,925	2,59,269
<b>Total Recognised Institutions</b>	1,04,627	1,66,130	2,11,308
Number of Students	38,86,493	73,96,560	128,88,044

Note: 1901-2 figures include Burma and some Indian States, while 1921-22 and 1936-37 figures are for British India only.

So, between 1900 and 1950 the growth in higher education was only modest 5 to 15 universities. Colleges going up from 145 to 270 students going up to 85,000, professional colleges students going to 20,000.

**(Refer Slide Time: 13:45)**

## Development of Scientific Research in India (1900-1950)

**The Indian Institute of Science** was established in 1909 with munificent donations from the endowment created by Jamshedji Nusserwanji Tata (1839-1904) and the Government of Mysore.

**The Indian Science Congress Association** was initiated by two British Chemists, Profs. J. L. Simonsen and P. S. Macmohan. The first Science Congress was held in Calcutta in January 1914 with Sir Asutosh Mukherjee as the President.

The Indian Institute of Science was set up in 1909 with munificent donations of the Tata's and the government of Mysore. The Indian's Congress Science Congress Associations was started in 1914 with the first session in Calcutta.

**(Refer Slide Time: 14:02)**

## Development of Scientific Research in India (1900-1950)

**The Indian Academy of Sciences** was founded by Chandrasekhara Venkata Raman (1888-1970) in Bangalore in 1934 with 65 Fellows, with the aim of promoting the progress and upholding the cause of science, in both pure and applied branches. It has currently about 1060 Fellows.

**The Indian National Science Academy** was started as the National Institute of Sciences in Calcutta in 1935 with 125 Fellows with the object of promoting science in India and harnessing scientific knowledge for the cause of humanity and national welfare. Sir Lewis Fermor was the founder president (1935-36); Meghnad Saha (1893-1956) became the first Indian President in 1937. The Academy shifted to Delhi in 1951.

The Indian Academy of Sciences was founded by Raman in 1934 with 65 founding Fellows. It has about 1060 Fellows now. The Indian National Science Academy was started around 1935. Sir Lewis Fermor was its first president, Meghnad Saha became the first Indian president shifted to Delhi in 1951.

**(Refer Slide Time: 14:21)**

## "An Indian Academy of Science"

In an unsigned editorial entitled "An Indian Academy of Science" that he wrote in the *Current Science* in May 1933, C. V. Raman highlighted the importance of building a national scientific community and associated institutions such as academies, journals etc. for fostering scientific research in India.

Since many of these issues remain relevant even today, we present a few extracts from Raman's editorial:

"It is true that individual scientific workers in India have by their indefatigable industry achieved great distinction for themselves, but the prestige of both official and non-official research is still slow in attaining that status of international importance reached by most European countries. This unsatisfactory position is in our opinion partly due to the tendency of many scientific men to export their more important contributions for publications in foreign journals, with a proportionate impoverishment of Indian archives."

While setting up the Indian Academy of Science Raman try to give an agenda for the academies or for the Indian Scientific Community. Essentially he was trying to highlight the importance of building a national scientific community and associated institutions for fostering scientific research in India.

**(Refer Slide Time: 14:39)**

## "An Indian Academy of Science"

"Manifestly the edifice of science in India is incomplete. If scientific contributions from countries which possess national journals are also sent abroad, let it be remembered that they represent a surplus, broadcasting the embellishments of their own national organizations."

**"It is true that the spirit of science and its service are international, but is it not also true that every nation has its own Academies, learned societies magazines and journals? "**

**"India will have to organize and develop her national scientific institutions before she can enter into the comity of international scientists."**

"The achievements of Indian science are national assets, and an Academy which treasures and displays them collectively is assured of providing the necessary guidance and inspiration for the younger generation to put forth greater exertions in order to enrich and widen the usefulness of this great estate."

A detailed editorial which you can see I have put it down here. One of the main things Raman is trying to say is that it is true that the spirit of science and its service are international. But is it not also true that every nation has its own Academies, learned societies, magazines and journals. India will have to organize and develop her national scientific institutions before she can enter into the comity.

This was a call to the scientific community to work as a national scientific group that will be there.

(Refer Slide Time: 15:09)

**Development of Modern Mathematics in India (1910-1950)**

**Syamdas Mukhopadhyaya** (1866-1937) was a student of Presidency College, he proved the famous "four-vertex theorem" in global differential geometry in the Bulletin of the Calcutta Mathematical Society in 1909. He continued to be a major contributor to the Journal for several decades.

**Ganesh Prasad** (1876-1935) studied in Cambridge and Gottingen and taught at Allahabad, Benares (1905-1923), and Calcutta Universities. He worked on potential theory and summability. His two volume work *Some Great mathematicians of the Nineteenth Century* (1933) was a landmark publication in the history of mathematics.

**K. Ananda Rau** (1893-1966) was a student of Hardy at the time Ramanujan was in Cambridge and served as a Professor at Presidency College, Madras, from 1919. He was an outstanding analyst and teacher of many prominent Indian mathematicians.

Now I will quickly tell about the important names in the development of mathematics. This will only be names now. Their work I cannot really discuss in this short period but perhaps it is good to know these names. Prior to independence we have Syamdas Mukhopadhyaya and Ganesh Prasad both in Calcutta. Ananda Rau was a very important professor in Presidency College.

(Refer Slide Time: 15:32)

**Development of Modern Mathematics in India (1910-1950)**

**Prasanta Chandra Mahalanobis** (1893-1972), was a contemporary of Ramanujan at Cambridge. He founded the Indian Statistical Institute in 1931, the first institute devoted to Mathematics research in modern India. The Journal *Sankhya* was started in 1933. Mahalanobis was elected an FRS in 1945.

**Ramaswamy S. Vaidyanathaswamy** (1894-1960) was a student of E. T. Whittaker and H. F. Baker. He served as a Professor at Madras, from 1927. He worked on lattice theory and topology. He served as the editor of the *Journal of Indian Mathematical Society* during 1927-1950. He wrote a pioneering *Treatise on Point Set Topology* (1947).

**Raj Chandra Bose** (1901-1987) was also associated with the Indian Statistical Institute. He did important work on design theory and error correcting codes. He migrated to the United States in 1947.

Mahalanobis who founded the Indian Statistical Institute. Professor Vaidyanathaswamy who was here in Chennai, Raj Chandra Bose who was in the Indian Statistical Institute.

(Refer Slide Time: 15:43)

## Development of Modern Mathematics in India (1910-1950)

**Subbayya Sivasankaranarayana Pillay** (1901-1950) was a student of Ananda Rau and worked in the Annamalai University during 1929-41. He is well known for his work on the Waring problem in number theory. He also worked on Diophantine approximation.

**Tirukkannapuram Vijayaraghavan** (1902-1955) was a student of Hardy at Oxford during 1925-28 when he did notable work on summability. He later joined André Weil at Aligarh University during 1930-32 and moved on to Dhakka. He did important work on nonlinear differential equations and Diophantine approximation. He was the first Director (1950-55) of the Ramanujan Institute of Mathematics set up with the munificence of Alagappa Chettiar in Madras.

**Subbaramaiah Minakshisundaram** (1913-1968), a student of Ananda Rau at Madras, he later specialised in partial differential equations. He worked at Andhra University at Visakhapatnam. His work on the eigen-functions of Laplace operator in Riemannian Manifolds is highly acclaimed.

SS Pillay who worked in Annamalai University, T Vijayaraghavan whose name you came across in the discussion on magic square. Minakshisundaram he is also very famous mathematician, he worked it.

(Refer Slide Time: 15:56)

## Development of Modern Mathematics in India (1950-2010)

**Harish Chandra** (1923-1983): One of the most distinguished mathematicians from India in modern times, Harish Chandra did his Masters in Physics at the University of Allahabad. During 1943-45 he worked with Bhabha at the Indian Institute of Science.

In 1945, he left for Cambridge University to work with the renowned theoretical physicist P. A. M. Dirac and was awarded PhD for his work on the Lorentz group in 1947.

During his stay at the Princeton Institute of Advanced Study in 1947-49, Harish Chandra shifted to mathematics. He taught at Columbia University during 1950-1963 and returned to the Institute of Advanced study in 1963, where he served as IBM von Neumann research Professor.

But in the last 50 years in our post independent era the most famous Indian mathematician has been Harish Chandra. Harish Chandra was a student of Physics from Allahabad then he went to Bhabha. Then he left to Cambridge with to work with the renowned Dirac. He did his thesis on Lorentz group and then during his stay in institute for Advanced Study in 1947 to 1949 Dirac was also visiting.

Harish Chandra shifted to mathematics. Then he taught in Columbia later on came back to institute for advanced study.

(Refer Slide Time: 16:30)

## Development of Modern Mathematics in India (1950-2010)

Harish Chandra is considered to be a pioneer in the area of Harmonic analysis of Lie groups. Robert Langlands wrote in an article on Harish Chandra that

“He was considered for the Fields Medal in 1958, but a forceful member of the selection committee in whose eyes Thom was a Bourbakist was determined not to have two. So Harish Chandra, whom he also placed on the Bourbaki camp, was set aside.”

Harish Chandra was elected an FRS in 1973, the second Indian to be so honoured in the field of Mathematics after Ramanujan. Harish Chandra took up US citizenship in 1980. Soon thereafter, in 1981, he was elected a Fellow of the US National Academy of Sciences.

And he is really a pioneer in the field of what is known as the field of Harmonic analysis of Lie groups. His name was considered for the famous Fields Medal that is to be given before the age of 40 and it is equivalent to its thought of as the Nobel Prize in mathematics. So, Harish Chandra was born in 1923, I think. 1923, so in 1958 he was due.

But somehow it was thought that already is getting and he belong to the Bourbakist group and people did not want more than 1% from the Bourbakist camp to get and Harish Chandra did not get the Fields Medal. Got of course FRS and late towards the end of his life also became a Fellow of the US Academy of Sciences.

(Refer Slide Time: 17:16)

## Development of Modern Mathematics in India (1950-2010)

The Indian Statistical Institute and the Tata Institute of Fundamental research have been the premier research institutions in India in Mathematics.

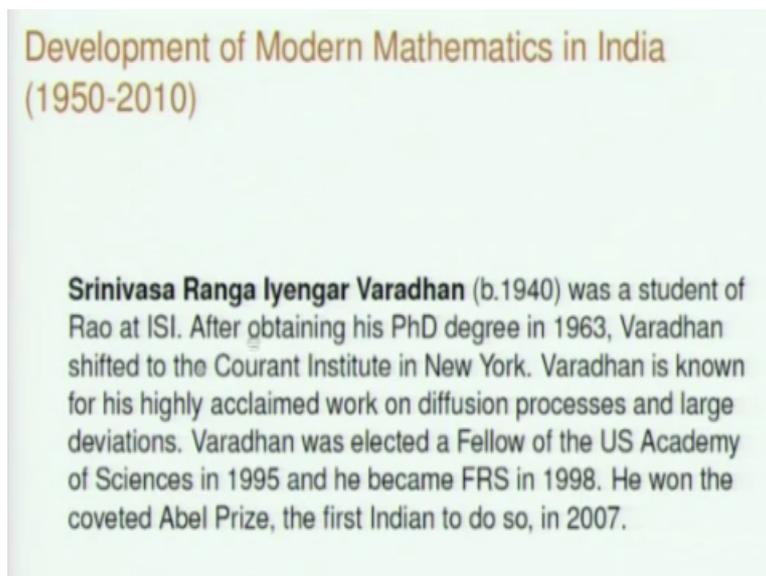

**Indian Statistical Institute**, which was founded in 1933 by P. C. Mahalanobis, produced many distinguished statisticians and mathematicians.

**Calyampudi Radhakrishna Rao** (b.1920), the renowned statistician, was a student of the Andhra and Calcutta Universities. Rao acquired his PhD degree working with R. A. Fisher at King's College, London, in 1948. He joined the ISI and later served as its Director. Rao is well known for many outstanding contributions such as Cramer-Rao bound and Rao-Blackwell theorem. There have been a number of well known mathematicians and statisticians who have been his students. He was made an FRS in 1967. Since 1978, Rao has been a distinguished professor at many US universities.

The 2 premier institutions which have posted mathematics research in India have been the Indian Statistical Institute and the Tata Institute of Fundamental research. The Indian Statistical Institute was founded in 1933. It also started the journal Sankha or Sankhya. The Professor C. R. Rao, a famous statistician he was a student of Fisher in London. He trained most of the famous mathematicians and statisticians in Calcutta.

He is well known for his work on Cramer-Rao bound, Rao-Blackwell theorem, etc. Since 1978, Rao has been a distinguished professor in many American Universities.

**(Refer Slide Time: 17:53)**

Professor S. R. S Varadhan, he was a product of the statistical institute. He going to Courant Institute in New York. In 2007 Professor Varadhan was the first Indian to be awarded the coveted Abel Prize.

**(Refer Slide Time: 18:14)**

## Development of Modern Mathematics in India (1950-2010)

**The Tata Institute of Fundamental Research** was founded in 1945 at the initiative of Homi Bhabha (1909-1966) with the help of Sir Dorabji Jamshedji Tata Trust.

**Komaravelu S. Chandrasekharan** (b. 1920), a student of Ananda Rau at Madras, was with the Princeton Institute of Advanced Study when he was invited by Bhabha to organise the School of Mathematics at TIFR. Chandrasekharan is known for his work on the complex variables and multiple Fourier series. Chandrasekharan left TIFR in 1965 and is currently professor emeritus at ETH Zurich. TIFR School of mathematics produced many eminent mathematicians.

Tata Institute started a mathematic school and Bhabha invited professor Chandrasekharan who was then in Princeton Institute of Advance Study to come in and start this school and many, many important mathematicians were trained in this school.

**(Refer Slide Time: 18:29)**

## Development of Modern Mathematics in India (1950-2010)

Three members of the School of Mathematics at TIFR have distinguished themselves by the award of FRS.

**Conjeevaram Srirangachari Seshadri** (b.1932) was a student of Chandrasekharan at TIFR. He has done highly acclaimed work in algebraic geometry, especially on unitary vector bundles (in collaboration with Narasimhan) and Schubert varieties. He founded the Chennai Mathematical Institute in 1989. He was awarded FRS in 1992.

**Mudumbai Seshachalu Narasimhan** (b.1932) was a student of Chandrasekharan at TIFR. He has done highly acclaimed work in algebraic geometry. He worked as Head of the Mathematics group at the ICTP during 1992-1997. He was awarded FRS in 1996.

**Madabusi Santanam Raghunathan** (b.1941) was a student of Narasimhan in TIFR. He has done highly acclaimed work on discrete subgroups of Lie groups. He was awarded FRS in 2000.

3 of the Tata Institute mathematicians have been awarded the distinction of Royal Society. C. S. Seshadri, who founded the Chennai Mathematical Institute here. M. S. Narasimhan and M. S. Raghunathan have all be awardees of the FRS. So, this has some of the major names, I mean one could go and list many more names and but one should also describe their work.

So in the next 25-30 minutes, I will try to give you an assessment of the growth of science and the growth of mathematics in India and place it in the global context as to where does

India stand in higher education? Where does India stand in global scientific research? Where does India stand in global mathematics research?

**(Refer Slide Time: 19:20)**

**Development of Education in India (1950-2010)**

**Number of Institutions**

Years	Primary	Upper Primary	Sec./ Sr.Sec/	Colleges	Universities
1950-51	209,671	13,596	7,416	578	27
1960-61	330,399	49,663	17,329	1,819	45
1980-81	494,503	118,555	51,573	4,722	133
1990-91	560,935	151,456	79,796	5,748	184
2000-01	638,738	206,269	126,047	10152	254
2005-06	772,568	288,493	159,667	16982	350
2010-11	748,547	447,600	200,184	33,023	564

As you can see the development of education in India has been phenomenal from independence 27 to 564 universities have come. From 600 colleges to some 33,000 colleges are there. Secondary schools have grown even more about 2 lakhs. The primary schools have also grown from about 2 lakhs to 7.5 lakhs. So, there has been a big growth of education in India.

**(Refer Slide Time: 19:44)**

**Development of Education in India (1950-2010)**

**Enrolment in Millions**

**Enrolment in Millions**

Year	Primary (I-V)	Middle (VI-VIII)	Sec./Sr.S (IX-XII)	Colleges/Univ
1950-51	19.2	3.1	1.5	.40
1960-61	35.0	6.7	3.4	1.05
1980-81	73.8	20.7	11.0	2.75
1990-91	97.4	34.0	19.1	4.93
2000-01	113.8	27.6	27.6	8.40
2005-06	132.1	52.2	38.4	11.03
2010-11	135.3	62.06	51.20	16.98

And the number of students studying there has also gone up significantly. In 1950-1951 there were only about 4 lakhs students in colleges. Today there are about 170 lakh students in

studying in higher education, 1.7 crores by I mean, I am saying today this all refers to 2010-2011, so in the last 2 years this number would have gone up further.

13.5 crores students in the 5 primary, 6.2 crores in the middle school, 5.1 crores in the senior secondary and 1.6 crores - 1.7 crores in the colleges. This is the kind of enrollment that we have. But this enrollment has to be understood in relation to the demography of India that how many of the people in that corresponding age group are attending this institution because India is a today it has a population of 120 crores.

So, we have to understand to see the progress in education.

**(Refer Slide Time: 20:49)**

**Low Enrolment and High Dropout Rate at Schools (1950-2010)**  
Gross Enrolment Ratio:

Year	Primary (I-V)			Upper Primary (VI-VIII)			Secondary (IX-XII)		
	Boys	Girls	Total	Boys	Girls	Total	Boys	Girls	Total
1950-51	60.6	24.8	42.6	20.6	4.6	12.7			
1960-61	82.6	41.4	62.4	33.2	11.3	22.5			
1980-81	95.8	64.1	80.5	54.3	28.6	41.9			
2000-01	104.9	85.9	95.7	66.7	49.9	58.6			
2005-06	112.8	105.8	109.4	75.2	66.4	71.0			
2010-11	115.4	116.7	116.0	87.7	83.1	85.5	55.5	48.4	52.1

Drop out Ratio

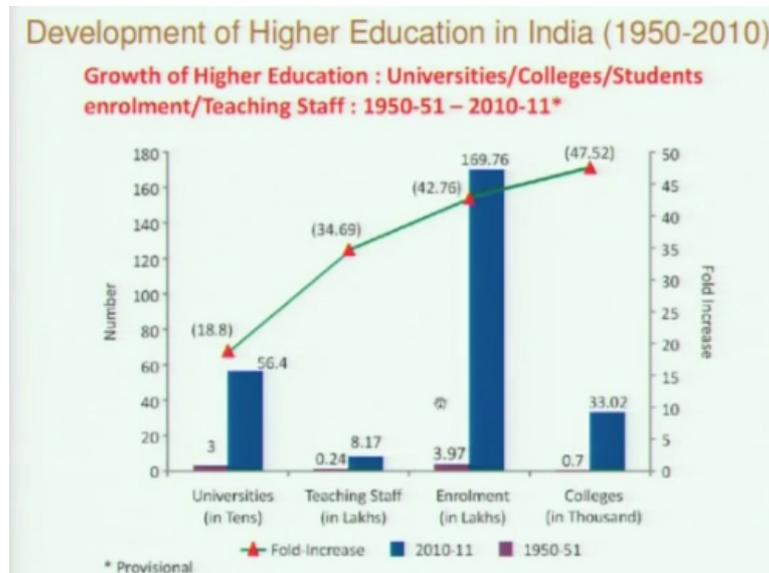

Year	Primary (I-V)			Elementary (I-VIII)			Secondary (I-X)		
	Boys	Girls	Total	Boys	Girls	total	Boys	Girls	Total
1960-61	61.7	70.9	64.9	75.0	85.0	78.3	N.A	N.A	N.A
1980-81	56.2	62.5	58.7	68.0	79.4	72.7	79.8	86.6	82.5
2000-01	39.7	41.9	40.7	50.3	57.7	53.7	66.4	71.5	68.6
2005-06	28.7	21.8	25.7	48.7	49.0	48.8	60.1	63.6	61.6
2010-11	28.7	25.1	27.0	40.3	41.0	40.6	50.4	47.9	49.3

We should look at what is called the gross enrollment ratio which is the ratio of the number of students in the particular section divided by the corresponding age group in which the total number of children in the corresponding age group. So, the enrollment in primary is almost more than 100 that means that the age group data many more students are studying in the primary schools.

But the enrollment in upper primary which, enrollment even in primary is very low in 1950 it was 40%. It has only around 2,000 that it is crossing 100%. Enrollment in upper primary has gone up from 12 to about 85 but in secondary education itself you see the enrollment is only 50%. That is from 9 to 12 classes only 50% of the children of the corresponding age group are going.

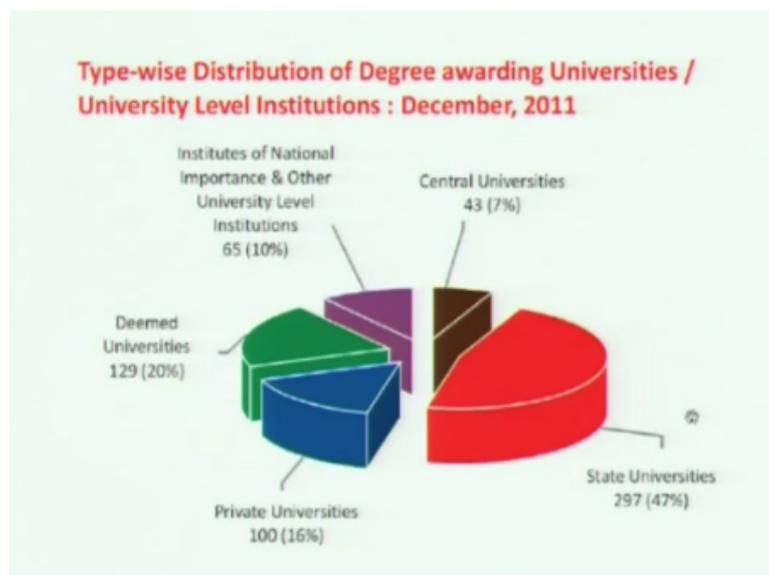

And there is something called the dropout ratio in India by the 5th standard about quarter of children dropout. By 8th standard about 40% of the children dropout by 10th standard almost half the children dropout from the education stream. This also very important indicate.

**(Refer Slide Time: 21:58)**

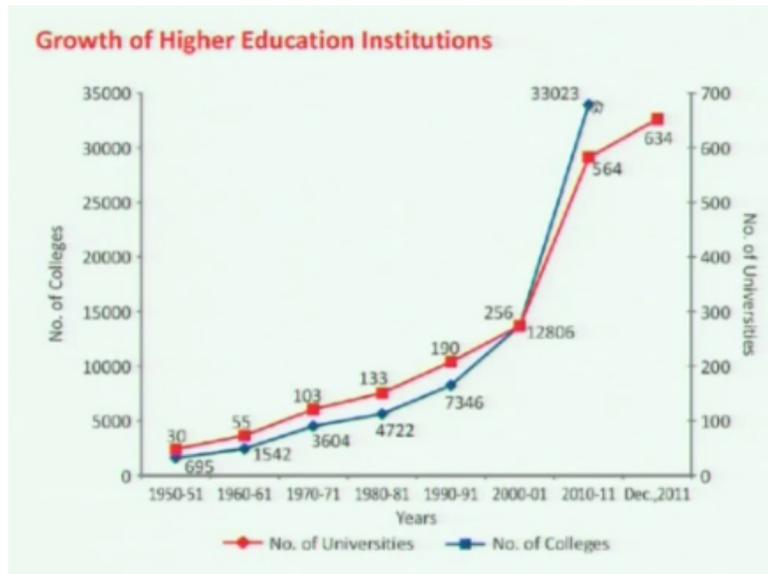

But now we quickly come to higher education only. The school and other education systems we will not bother. So, this already I told you, 33,000 colleges and about 564 universities about 8 lakh teachers about 1.7 crores students that has been the growth.

**(Refer Slide Time: 22:24)**

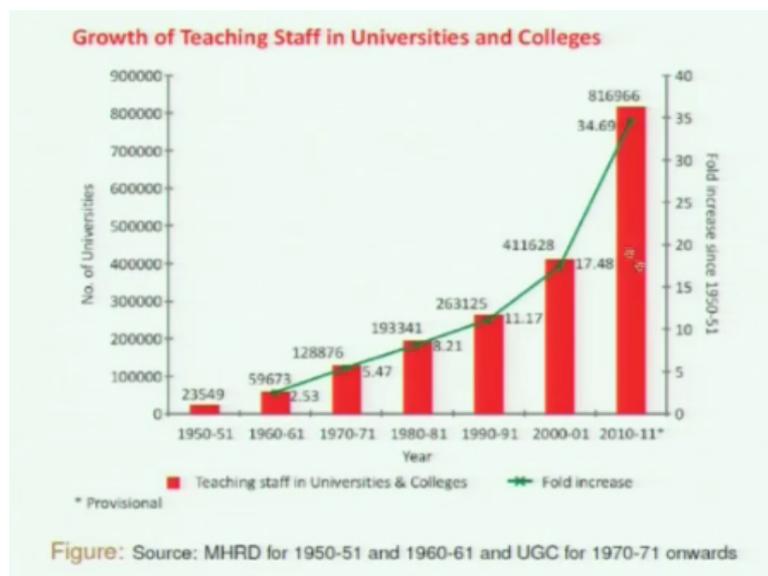

So, our universities which we counted it around 600, 300 of them are State Universities, 43 are Central Universities, 65 are Institutions of National importance, 130 Deemed Universities, 100 Private Universities. So, these are the degree awarding institutions.

**(Refer Slide Time: 22:44)**

And of the 33,000, 634 universities and 33,000 colleges. You can see the number of colleges has grown in the last 2 decades. In 1990-1991 there was only 7000 colleges. There were 12,000 in the beginning of the last decade and now there about 33,000 colleges.

**(Refer Slide Time: 23:04)**

Teachers have also gone up to about 8 lakhs.

**(Refer Slide Time: 23:08)**

## Halting Growth of Higher Education in India (1980-2010)

The gross enrolment ratio (GER) in higher education (given as a percentage) is the ratio of the number of students studying in colleges and universities to the total population in the age group 18-24.

### The GER in higher education in India

Year	1951	1961	1980	2001	2005	2009
GER (%)	0.7	1.4	5	8	11	15

So, first is the gross enrollment ratio in higher education. So, you take the age group 18 to 24 what is the total population there and you take the number of students enrolled in higher education. So, divide the later by the former as a percentage that is called the gross enrollment ratio in higher education. It was very low in 1951 it was raising. So, it close to almost 5% by 1980.

But afterwards it has been sort of growing rather slowly. It has grown 7 times in the first 30 years. In the next 30 years, this figure is actually contested, so it has hardly grown 3 times.

**(Refer Slide Time: 23:53)**

## Halting Growth of Higher Education in India (1980-2010)

### GER FIGURES FOR 2010<sup>1</sup>

**India: 18%** (with enrolment of 20.75 million)

China: 26% (with enrolment of 31.05 million). China had a GER of 3% in 1992, which rose to 16% in 2002 and to 20% in 2005.

USA: 76% (with enrolment of 20.4 million)

Russian Federation: 76% (with enrolment of 9.33 million)

**World average: 29%** (with enrolment of 177.7 million)

North America and Western Europe: 76%, Latin America and Caribbean 41%

East Asia and Pacific: 29% [Korea 103%, Japan 60%, Thailand 48%, Malaysia 40%, Indonesia 23%, Vietnam 22%]

<sup>1</sup>Source: UNESCO's *Global Education Digest (2012)*

But now to understand this we should understand it in the global context. So, what is the gross enrollment ratio in various countries in the world that is the with which we have to

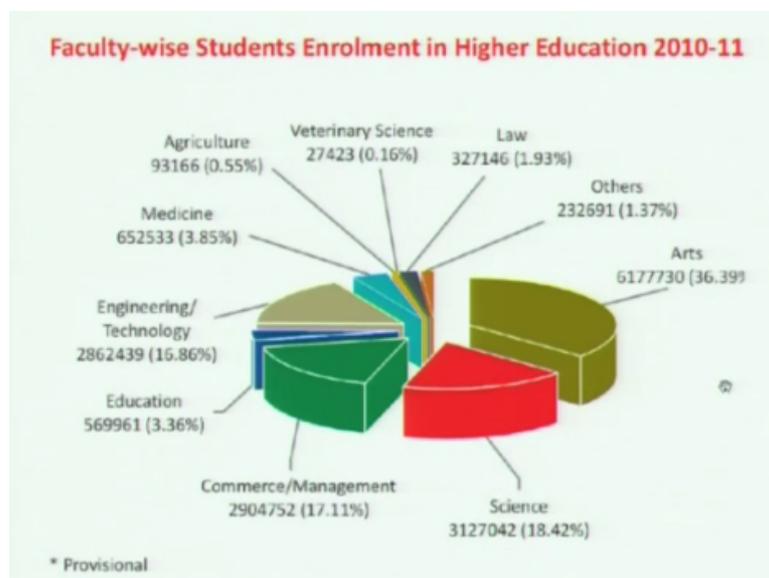

compare. So, this is the UNESCOs Global Education Digest up 2012. So, they are giving 18% GER per India with 20.75 million, 2 crores this is more than the 1.7 crores I mentioned.

I think they are taking it to account students in the distance educations scheme also and things like that. So, that is I think what we will make in 2 crores and that gives an enrollment ratio of 18%. The world average is 29%. And East Asia Pacific, Korea is 100%, Japan 60%, Thailand 48, Malaysia 40, Indonesia 23 and of course China which has a total enrollment more than ours we have 20 that is 2 crores they have about 3 crores in their colleges.

It had a very low gross enrollment ratio of 3% in 1992. It has risen to 16% in 2002 and it has risen to 26% in 2010. So, the moment they have decided to go for higher education in a big way they have been able to move very fast. USA, of course has 76% gross enrollment. So it has a total enrollment, India is second in the world in this data. Chinese have about 3.1 crores India is about 2.1, USA has about 2.05.

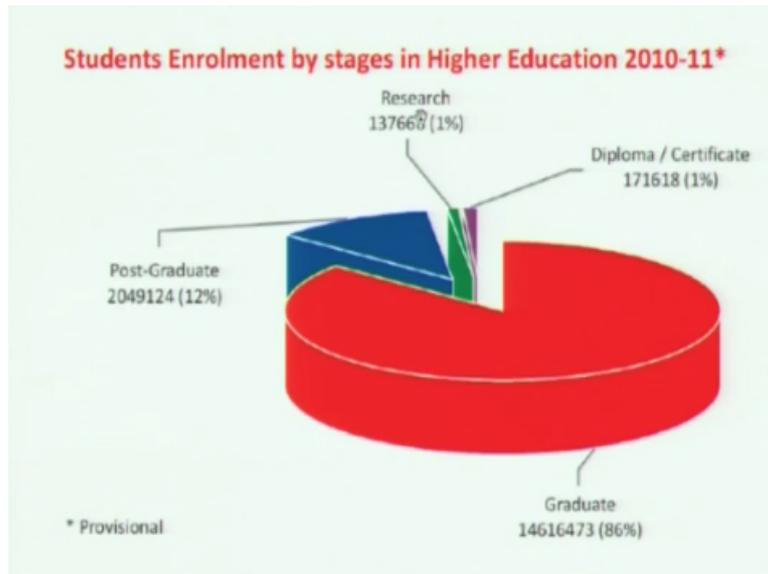

So, that is where we stand in the gross enrollment in the world as a whole and next is how do we stand in higher education.

**(Refer Slide Time: 25:29)**

So, the break up for this higher education is something like this. About 18% of all students studying in higher education study science, about 36% study arts, about 17% study commerce and management, about 4% medicine, about 2% Law, 3% study education. That is the distribution by subject.

**(Refer Slide Time: 26:03)**

So, 86% of the higher education students are what we call us under graduates. Only 12% about 20 lakh students are in post graduate institutions and < 1% about 1.3 lakh students are in research. So, this is the kind of break up. And therefore consequently the total number of PhD's in India is of the order of 10,000 of which 3,000 each year, I mean this is the year of 2009 and 2010.

Science PhD's is about 3,742, arts is 3,500, engineering and technology is about 1,000, medicine is 337. So, this is the growth in quantity. So, what is the output? So, output is usually measured one in terms of scientific publications and another in terms of patents, etc. I am only looking at since we are looking at mathematics pure science, we will look at the output in terms of scientific publications.

**(Refer Slide Time: 27:14)**

**India in the World of Science (1996-2010)**

Country	Publications Output			Publications Share		
	1996-10	1996-98	2008-10	1996-10	1996-98	2008-10
USA	5322590	960747	1328564	22.83	27.78	21.21
China	1848727	94875	843949	7.93	2.74	13.48
UK	1533434	249366	393576	6.58	7.21	6.28
Japan	1464273	256624	330106	6.28	7.42	5.27
Germany	1396126	224877	355992	5.99	6.50	5.68
France	1021041	166997	267031	4.38	4.83	4.26
Canada	790397	140124	221833	3.39	4.05	3.54
Italy	762290	112521	211549	3.27	3.25	3.38
Spain	583554	74244	179875	2.50	2.15	2.87
India	533006	63153	185676	2.29	1.83	2.96

So between 1996 to 2010, where does India stand? Currently India is producing about 3% of the world scientific publications. USA is about 21 and China is about 14% - 13.5% of the world scientific publications. Moving to the next page, South Korea is producing about 2.5%.

**(Refer Slide Time: 27:35)**

Data from SCOPUS in B. M. Gupta, Ind Jour Sc Tech. 2010, p.2900

But the growth from 1996 to 2008 India is more or less it was about 1.83 has gone to 2.96. The Chinese were about 2.74 in 1996, currently they are contributing about 13.5% of the world scientific output and this is in numbers. This is about 8,43,000 papers in those 3 years which means about 2.8 lakh papers per year. Indians are producing 1,85,000 which means about 60,000 scientific publications are each year are emanating from India.

There are other countries like Taiwan, South Korea, Brazil which have shown considerable growth in this period. Brazil has grown more than 2 times, Taiwan has grown about 2 times, South Korea has grown more than 2 times in the last 12 years. In 1970 the people who studied growth of science in India they almost hailed India as a Research super power in the Third World.

**(Refer Slide Time: 28:54)**

## India Hailed as a Research "Superpower" in the Third World in 1970's

Analysing the SCI (Science Citation Index) publication data of 1973, and the citation data for 1973-78, Eugene Garfield hailed India as a "Research 'super power' of the Third World":

"About 353,000 articles are indexed in the SCI [in 1973]... and these articles received two million citations during 1973-78....'First World' countries account for 84% of 1973 articles and 90% of 1973-78 citations....

[Among] the top 25 countries in terms of the number of articles written by their authors, only two Third World countries appear – India and Argentina.

There is something called the Science Citation Index which is a major database of all scientific articles and also analysis citations. So, Eugene Garfield originator of this Science Citation Index. Wrote he made an analysis of the publication data of 1973 and the citation data, citation means the number of times the paper is refer to by others in during the 5-year period and he called India a Research super power.

So, in 1973 about 3.5 lakh articles were indexed about 84% of the articles came from the First World and about 90% of all the citations also came from the First World. But then he saying amongst the top 25 countries in terms of the numbers of articles written by their authors, only 2 Third World countries appear India and Argentina, this in 1973.

**(Refer Slide Time: 29:44)**

## India Hailed as a Research "Superpower" in 1970's

India's rank is significant. It is considered to rank third in the world in the number of researchers behind the US and USSR. But it ranks eighth when we consider the number of articles its researchers authored ...

In fact Indian researchers alone authored half of the 16,000 articles from the Third World. Out of the 93 Third World author countries in the 1973 SCI database, authors from 30 developing countries authored more than 50 papers. ...Clearly India is a research 'superpower' in the Third World. Argentina is a distant second, accounting for ... a fifth of India's output."<sup>2</sup>

<sup>2</sup>Garfield, Mapping Science in the Third World, Science and Public Policy, 10, 1983, pp 112-127

India is considered to rank third in the world in the number of researches. This an old thing, so in 1970s this would have been the key situation after US and USSR. But it ranks 8 in the number of publications. But then he is saying that Indian researchers have authored half of the 16,000 articles return from the Third World and the only other country is Argentina which is the distant second accounting for one fifth of India's output.

Clearly, India is a Research super power in the Third World. This was result of impression that the situation in 1970s was coming on the growth of science in India.

**(Refer Slide Time: 30:21)**

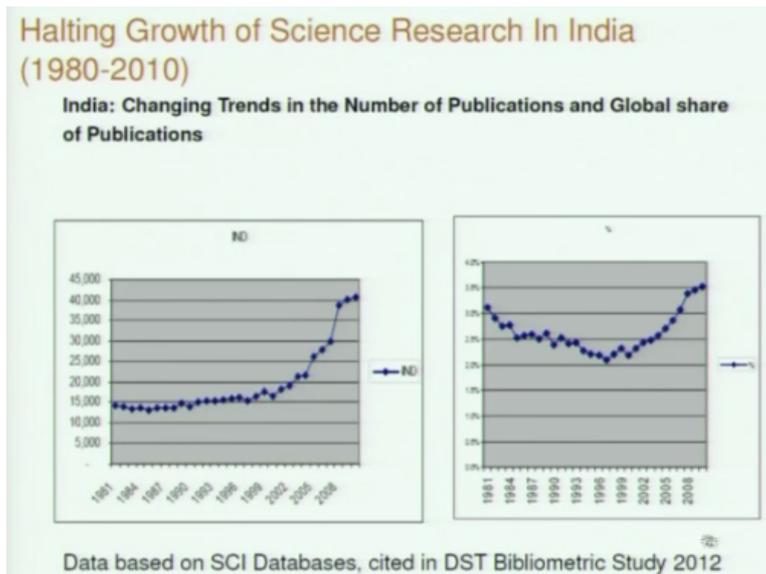

**India Hailed as a Research "Superpower" in 1970's**

Country	Articles	Citations
US	151,939	1,047,854

*Argentina	1526	4110

Source: Garfield, Mapping Science in the Third World, Science and Public Policy, 10, 1983, pp 112-127

So, this is the 1973 data. US has about 1.6 lakh papers which are cited about a million times that means 6 citations per paper amongst all these 25 countries, India which had about 8,000 papers has a citation index below 2 is of course the lowest amongst all these 25. But in terms of the volume of publications at least India ranked 8 in the world and it was the only Third World country to be significantly performing in science then in 1970s.

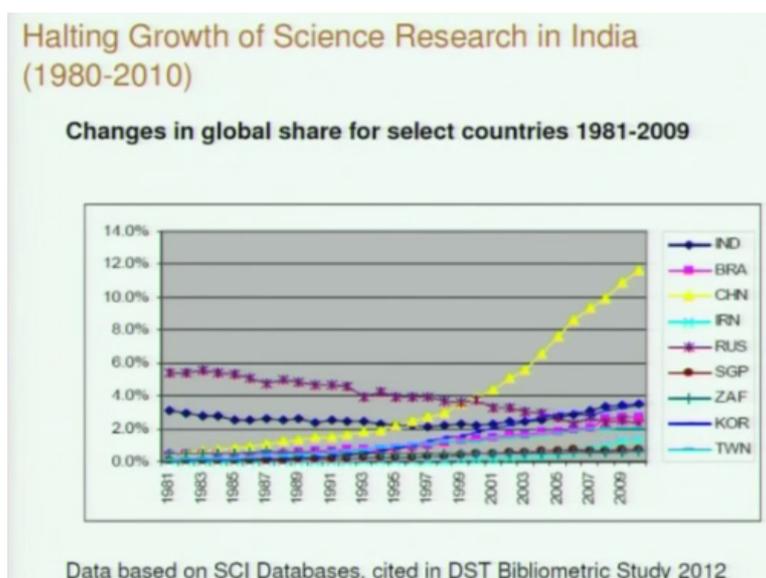

**(Refer Slide Time: 30:57)**

Well, this situation seems to be a totally transformed and reversed in the next 30-40 years. So, this is a DST study. This was a study made by Thomson Reuters for the DST 2 years ago of scientific publications in various countries of the world. So, you can see the publications of India from 1981 we have gone up from about 15,000 to 40,000-45,000. The share at Indian publications in the world science publications has come down from 1981.

It was about 3% in 1981. It has come down to nearly 2% in 1996 and as again gone up to around 2% to 3% to 3.5% by 2008.

**(Refer Slide Time: 31:43)**

And what has happened in the same period is that many other countries have moved considerably faster and forward. So, here we have for the same period this is India, this blue

curve. Almost between 2 and 4, this yellow of course is China. It had less, although 0.2% in 1981 of the global publications share. It has gone more than 10% to 12% by 2010.

Russians are fluctuating they were about 6%. They are there but all these other countries are coming up. Korea, Taiwan, Singapore, Iran you can see all of them are raising, raising, raising and coming almost near to India if not more than the share. They are all tiny countries in comparison demographically but in terms of their scientific output they seem to be of the producing of the same order of magnitude as India in the share of publications in the world.

This, what has happened in the last 20-25 years. And the Indian situation is more than stable around between 2% and 3% of the world scientific output.

**(Refer Slide Time: 32:48)**

**Halting Growth of Science Research in India**

**Number of Papers with High Citation: India, China and Korea 1998-2007**

Year	India <sup>a</sup>		China <sup>a</sup>		South Korea <sup>a</sup>		Brazil <sup>a</sup>		Israel <sup>a</sup>	
	Papers	A	Papers	A	Papers	A	Papers	A	Papers	A

2007	35,953	10	98,329	41	33,570	23	27,661	19	12,555	20
Total	235,679	758	529,856	2142	222,555	1114	168,759	707	114,484	1989

Column A gives the Number of Papers receiving atleast 100 citations, \*Data collected on 22 November 2009:\*

Data from Web of Science in M. Madan et al. Current Science, 2010, p.739.

It is not nearly quantity you can analyze things in terms of quality also. The number of papers which are cited more than 100 times in the last 20 years there were only 800 Indian papers by this 2,000 Chinese, 1,000 Korean, 700 Brazilian, 2,000 Israeli papers were cited. So, it is not nearly a matter of quantity that others are moving fast. They are moving in terms of quality as the usually understood.

**(Refer Slide Time: 33:16)**

## Halting Growth of Science Research in India

### Number of Researchers in India, China, US and EU

	Researchers '000s		% world Researchers		Researchers per million inhabitants		GERD per Researcher ('000s ppps)	
	2002	2007	2002	2007	2002	2007	2002	2007
	India	115.9	154.8	2.3%	2.2%	111.2	136.9	102.6
China	810.5	1423.4	13.9%	19.7%	630.3	1070.9	69.4	72.0
USA	1342.5	1425.6	23.1%	20.0%	4566.0	4663.3	206.4	243.9
EU	1197.9	1448.3	20.6%	20.1%	2473.9	2936.4	172.1	182.9

Source: DST Bibliometric Study 2012

Again in terms of the total number of research personnel in the world Indian share is about 2% whereas the USA and European Union have about 20% of all researchers in the world. The Chinese have moved or moving very fast and they also now have about 20% of the researchers in the world. So, all of them have about this in thousands. So, this will be about 1.5 million China, USA and European Union.

India has about 1.5 lakh researchers about a 10th of that. But this is also significant this is called the per capital amongst them in ppp terms. Ppp terms means not the exchange term of 1 is to 55 Rupees per Dollar but in what is called the purchasing power clarity. We find that the Chinese are spending almost half of per scientist as the India. So, it is not really that we are not spending enough on our scientists some such thing.

We may not be spending enough still but others were spending much less are able to perform much more.

**(Refer Slide Time: 34:23)**

## Halting Growth of Science Research In India

Table: Number of Ph.D Degrees Awarded in S&T in Select Countries, 1983-2003.

Year	Number of Ph.Ds Produced in S&T								
	India	China	S.Korea	Taiwan	Japan	France	Germany	UK	USA

2002	5527	NA	3225	NA	7461	NA	11017	4380	26226
2003	6318	NA	NA	202	7581	NA	10796	3780	26891

Source NSF Science and Engineering Indicators 2006 Appendix Tables 2.42 and 2.43 NA=Not Available.

2008: 7982 28439 3716 2005 8017 7710 11314 9470 33369

So, in the number of PhD's awarded also India had about 8,000 in 2008, China had about 30,000 South Korea which had a very low number 280 in 1983 has about 4,000, Taiwan 2,000, Japan 8,000. So, like that this is the way. So, we are not really producing adequate number of PhD's for getting that kind of scientific output that others are moving towards.

So, now that was about the position in science as a whole and by now you can guess that will be reflected in mathematics also. It will not be this situation in mathematics will not be too much different. So, this is the sort of Thomason Reuters Web of Knowledge Database.

**(Refer Slide Time: 35:04)**

## India In World Mathematics Research (2001-11)

25	AUSTRIA	3,073	ROMANIA	8,583

Source: Web of Knowledge Database cited in G. Prathap, Curr. Sc., 102, 2012, p. 1349

They ranking by papers, ranking by citations for the publications in mathematics in the last 10 years 2001 to 2011. So, USA is producing about 7,500 papers per year, Chinese about 3,500, Indians are producing about 580 papers. So, in terms of number of papers we are about

14th below South Korea, below Poland, below Spain and Taiwan, Brazil, Israel are almost on our heels even Turkey, Iran.

And by citation also India is I think somewhat lower they have 6,000 papers are cited < 2 and in I think the total world publications this will also come around 2.4% or 2.3% of the share of world publications.

2000	1419	6552	1196	881	977	66885

S. Arunachalam, Curr. Sc.83,2002,p.253

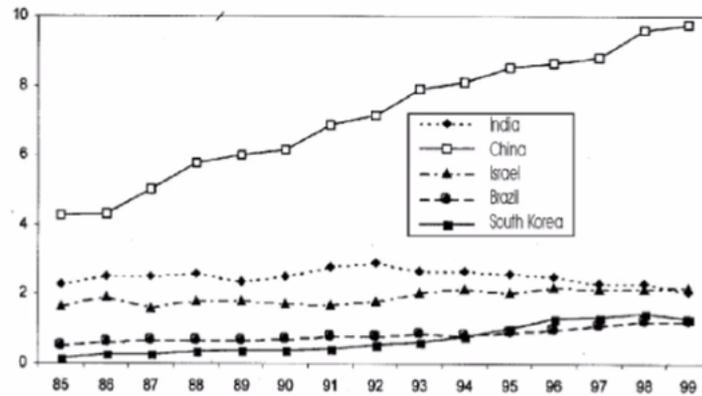

So, this is the growth of mathematics in India compared to China, Israel, Brazil. Some other study, which is important because even 10 years ago this fact was highlighted that we are really lagging behind in our research. Our output is not adequate in terms of the fact that we are some how's where are many other countries are really moving, who are hardly considered as major forces in science in 1970s or even early 1980s.

They are moving to a situation where they are becoming major scientific powers in the world.

## Halting Growth of Mathematics in India (1980-2000)

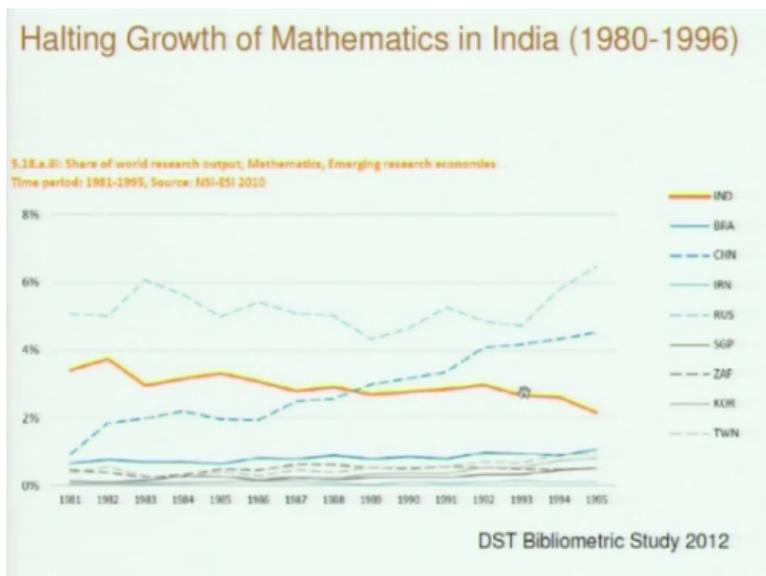

Share of World Publications in Mathematics 1985-1999

S. Arunachalam, Curr. Sc.83, 2002, p.253.

And so, here you can see between 1985 to 1999 this is the graph of Chinese publications and this is the graph of the Indian publications and others are catching up even then.

(Refer Slide Time: 36:48)

This is the more recent Reuters study. I think they have put India in Saffron color for whatever purpose. So, this is the Chinese they caught up with India around 1989 and they have moved up in 1985. This is the Russians. So, after 1996 the Chinese have gone out of this graph because this is 2%, 4%, 6%. They have gone to a different order of magnitude. The Russians are still there.

But all these others Korea, Taiwan, etc. are all coming close to India. Brazil they have a share which is that. So, this is the kind of picture that emerges I do not need to repeat it again and again.

### Halting Growth of Mathematics in India (1980-2010)

**Trends during 1996-2010**

"India's share of world Mathematics research output was around 2% over this period, and was broadly maintained at these levels.

In this later period, the USA's share of world Mathematics research output... was further eroded from 32.9% in 1996 to 23.6%, ultimately a fall of 17.3% (nearly half) on its 1981 level. France reached a share of 10.8% in 2003, but this fell to 8.8% by 2010. Germany's share also fell from a height of 9.4% in 2000 to 6.6% by 2010. Italy's share continued to rise from its 1981 levels overtaking Japan in 2005.

China in effect trebled its percentage world share of Mathematics research output, from 5.2% in 1996 to 16.7% by 2010. Korea began to overtake India from around 2003 onwards, although by 2009/2010, their world share was equal (2.4% by 2010). Brazil, Taiwan and also notably Iran increased their world share over this period too."

DST Bibliometric Study 2012

If you study these quantitative figures more carefully you will see various nuances of this picture.

### State of Higher Education and Research in India 2010

- ▶ Low enrolment in High Schools & Secondary Schools (50% in 2011) with high dropout rates in I-X (about 50% in 2011)
- ▶ Halting growth (compared to many countries of Asia and Latin America) of GER in higher education from 5% to 15% during 1980-2009.
- ▶ Only 550 Universities which grant degrees (in 2011)
- ▶ Proliferation of colleges 33,000 with average enrolment around 500

So, let us quickly try and summarize the situation as I understand from these figures of the state of higher education and research in India including mathematics. So, one is we have this low enrollment in high schools and secondary schools which is the input to our higher education. It is around 50% and at the same time we have this, 50% dropout by class 10.

Second is that the numbers enrolled in higher education is not growing really fast we have GER, gross enrollment ratio which is around 15% even that figure needs to be very well confirmed by the trends in the next few years. That means only one sixth or even one seventh

of the boys and girls in the age group 18 to 24 are getting into university, whereas the world average is about one third 29%.

There are only 550 universities which grant degrees. They are more than 33,000 colleges and an enrollment of about 17 million. So, that we leave on the average only about 400-500-600 students on the average per college.

**(Refer Slide Time: 38:48)**

### State of Higher Education and Research in India 2010

- ▶ Only 12% of students in higher education (17 million) enrolled in PG (2 million), and less than 1% in Ph.D (1.4 lakhs)
- ▶ Halting growth of PhDs awarded annually in Science (3750 in 2010), engineering (1000) and Medicine (300).
- ▶ India, which was hailed as a research "superpower" in the third world in the 1970's, has exhibited a rather halting growth in the global share publications in science, which has stayed around 2-3% during 1980-2010. while many countries of Asia and Latin America have shown high rates of growth.
- ▶ In Mathematics, India's global share of publications has declined from over 3% to 2% during 1981-1995 and has stayed around 2% during 1996-2010, while many countries of Asia and Latin America have shown high rates of growth.

So, this is the general picture. On research and post graduate education only 12% of the higher education the students are going for post-graduation and < 1% of the students having PhD and in science the situation is that we are producing only about 3,700 students a year in PhD. And in terms of the output, so India which was hailed as a Research super power in the Third World in 1970 as exhibited a rather halting growth in the global share science publications in science.

It has stayed around 2% to 3% in 1980 to 2010. While many countries of Asia and Latin America have shown much higher rates of growth and they have either attained the status of India or across them. And their demographically they are sort of very, very small compared to India. In mathematics also this the same thing in fact between 1981 to 1985 it declined Indian share in world publications in mathematics.

It has stayed around 2% during 1996 to 2010 again many other countries have.

These 3 articles discuss the important figures in the development of modern mathematics in India in the first half of 20th century. People like Syamdas Mukerji, people like this Vijayaraghavan all these S. S. Pillai and all they were discussed in great detail.

So, with this sort of I come to a close up the study of Modern Mathematics in India. Modern Mathematics did take root and blessed with the native genius Ramanujan in the beginning of

last century and after independence we have foster the growth of Modern Science and Mathematics in a fairly big way. But somehow in the last 30-40 years we do not seem to have gone up with the in the way we all to have really gone about developing our higher education in research.

So, our sort of situation seems somewhat stagnant. Essentially it appears that a very small percentage of Indians are participating in this activity of higher education and research compared to the really potentially large population of youngsters that we have in our country. And that seems to be one of the problem and that gets many of the studies in various other ways and therefore that results that only there are few institutions in India which would you would be in any has doing research.

And they will not have really the kind of numbers that will be there in corresponding times of institutions all over the world, say there are several reputed universities in USA which have about 30,000 to 40,000 student's studying in the same campus. And I do not think there is any university in India where in a single campus you are training under graduates of that kind of a number.

So, like that there are various factors when which this affiliated colleges which are not willing with research and higher studies. Many, many factors which is an inheritance from the British period higher education system in India which we thought was very valuable and took it over without making any major fundamental alterations in it. So, we make few alterations but we made no fundamental alterations from it.

And sort of the limits of stagnation of that system are very, very visible in the last 2-3 decades. And unless we do that transformation now these are in this decade or in the next decade we will not be really contributing to the worlds knowledge nor we will be establishing a new sort of genre or mathematics a new school of mathematics that is where the to be in continuation with the great tradition of mathematics that I have discussed that we have discussed and described during the course. Thank you very much.
