Lecture – 49
Examples and Applications on QR-decomposition

So, we had done quite a few things in the previous few classes. What would like to do is that I would like to first do some exercises related with QR decomposition and if time permits then we will look at some ideas that I have missed otherwise I will do that in the next class alright. So, let me look at some of the examples for QR decomposition.

(Refer Slide Time: 00:40)

The image shows a handwritten solution on a digital whiteboard. The text reads:

 Examples ① Let $A = \begin{bmatrix} 1 & 0 & -1 & 2 \\ 0 & 1 & 1 & 1 \\ 0 & 1 & 1 & 1 \end{bmatrix}$. Find an orthogonal matrix Q

 and an upper Triangular matrix R s.t. $A = QR$.

 Soln: $u_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$, $u_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, $u_3 = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix}$ and $u_4 = \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix}$

 $w_1 = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$, $w_2 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, $w_3 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}$

 $v_3 = u_3 - \langle u_3, w_1 \rangle w_1 - \langle u_3, w_2 \rangle w_2$

 $= \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} - \frac{2}{2} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} - 0 = \begin{bmatrix} -1 \\ -1 \\ 1 \end{bmatrix} - \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} -2 \\ -1 \\ 1 \end{bmatrix}$
 The whiteboard interface includes a menu bar (File, Edit, View, Insert, Actions, Tools, Help), a toolbar with drawing tools, and a status bar at the bottom showing '42 / 53'.

So, examples; so, the 1st example is let A is equal to 1 0 1 0 0 1 0 1 1 minus 1 1 1 2 1 1 1 alright, fine. Question is, find an orthonormal matrix Q. So, I write it as orthogonal because

that is the way this written there in the orthogonal matrix Q and an upper triangular matrix R such that A is equal to QR alright.

So, let us look at the solution. So, now, the ordering is fixed there is a first column, second column, third column and fourth column. So, we will have to go and do your calculation based on that itself. So, let me write u_1 as $1\ 0\ 1\ 0$, u_2 as $0\ 1\ 0\ 1$, u_3 as $1\ -1\ 1\ 1$, and u_4 as $2\ 1\ 1\ 1$ alright. This is the way we are supposed to do. So, from here I get w_1 as 1 upon $\sqrt{2}$ times $1\ 0\ 1\ 0$. What about w_2 ? So, look at u_2 and this the inner product between u_1 and u_2 is already 0 .

So, w_2 is equal to 1 upon $\sqrt{2}$ times the same vector 1 upon $\sqrt{2}$ times $0\ 1\ 0\ 1$. If I look at u_3 alright, then u_3 is already perpendicular to u_2 look at this $-1\ 1$ and $1\ 1$ that is 0 . So, I have, but any how you have to compute what is v_2 . So, let me compute v_2 ; v_2 is sorry not $v_2\ v_3$.

So, v_3 is u_3 minus u_3 with w_1 w_1 minus u_3 with w_2 w_2 which is same as 1 minus $1\ 1\ 1$ minus inner product of u_3 with w_1 u_3 with w_1 is 1 into 1 plus 1 into 1 that is 2 and this square root of 2 comes twice. So, you divide by 2 here, fine and multiply by that. So, it is $1\ 0\ 1\ 0$ minus u_3 with w_2 .

u_3 with w_2 if you look. So, 0 times $1\ 1$ times -1 and 1 times 1 will give me 0 . So, it is a 0 for us. It does not give me anything. So, it is nothing, but 1 minus $1\ 1\ 1$ minus $1\ 0\ 1\ 0$ which is equal to 1 minus 1 is 0 minus 1 minus is $-1\ 1$ minus 1 is 0 and 1 here fine. So, be careful I always do mistakes as I said. So, I define w_3 is equal to 1 upon $\sqrt{2}$ times $0\ -1\ 1\ 0$.

(Refer Slide Time: 04:24)

$$u_1 = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 1 \\ 0 \end{bmatrix}, u_2 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 1 \\ 0 \\ 1 \end{bmatrix}, u_3 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ -1 \\ 1 \\ 1 \end{bmatrix}, u_4 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 1 \\ 0 \\ 1 \end{bmatrix}$$

$$v_3 = u_3 - \langle u_3, w_1 \rangle w_1 - \langle u_3, w_2 \rangle w_2$$

$$= \begin{bmatrix} 0 \\ -1 \\ 1 \\ 1 \end{bmatrix} - \frac{3}{2} \begin{bmatrix} 1 \\ 0 \\ 1 \\ 0 \end{bmatrix} - 0 = \begin{bmatrix} -3/2 \\ -1 \\ 1/2 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 0 \end{bmatrix}$$

$$v_4 = \begin{bmatrix} 2 \\ 1 \\ 1 \\ 1 \end{bmatrix} - \langle v_4, w_1 \rangle w_1 - \langle v_4, w_2 \rangle w_2 - \langle v_4, w_3 \rangle w_3 = \begin{bmatrix} 2 \\ 1 \\ 1 \\ 1 \end{bmatrix} - \frac{3}{2} \begin{bmatrix} 1 \\ 0 \\ 1 \\ 0 \end{bmatrix} - 0 = \begin{bmatrix} 1/2 \\ 1 \\ 1 \\ 1 \end{bmatrix}$$

$$= (2, 1, 1, 1)^T - (3/2, 0, 3/2, 0)^T - (0, 1, 0, 1)^T = (1/2, 0, -1/2, 0)$$

$$A = \begin{bmatrix} 1 & 0 & 1 & 2 \\ 0 & 1 & -1 & 1 \\ 1 & 0 & 1 & 1 \\ 0 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1/\sqrt{2} & 0 & 0 & 1/\sqrt{2} \\ 0 & 1/\sqrt{2} & -1/\sqrt{2} & 0 \\ 1/\sqrt{2} & 0 & 0 & -1/\sqrt{2} \\ 0 & 1/\sqrt{2} & 1/\sqrt{2} & 0 \end{bmatrix} \begin{bmatrix} \sqrt{2} & 0 & \sqrt{2} \\ 0 & \sqrt{2} & 0 \\ 0 & 0 & \sqrt{2} \\ 0 & 0 & 0 \end{bmatrix}$$

$Q \qquad R$
 $\sim w_2 \qquad \sim w_2$

So, now, I have to compute what is v 4. So, let us look at what is v 4. So, v 4 is 2 1 1 1 minus v 4 with w 1 w 1 v 4 with w 2 w 2 and v 4 with w 3 w 3. So, this is equal to this vector 2 1 1 1 minus v 4 with w 1. So, it is 2 plus 1 I think 2 plus 1 is 3, 3 upon 2 times 1 0 1 0 minus v 4 with w 2; v 4 with w 2 will be I hope I have done correctly 2 plus 1 sorry 1 plus 1 is 2.

So, it is just 0 1 0 1 minus v 4 with w 3; v 4 with w 3 is minus 1 here and 2 minus 1 is. So, 0 0 minus 1 0 once it is 0 here, fine. So, this is equal to let me write in terms of the row vector 2 1 1 1 transpose minus 3 upon 2 alright. So, 3 upon 2 0 3 upon 2 0 minus 0 1 0 1 which is equal to 2 minus 3 by 2 is half alright. 2 minus 3 by 2 is half, 1 minus 1 is 0, 1 minus 3 by 2 is minus 1 so, minus half, 1 minus 3 by 2 is minus half and that is 0, 1 minus 1 is 0. So, this is what I get, fine.

So, this will imply that w_4 is $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}$ or since I am writing in columns so, let me write column itself with a space $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$ alright. So, this is what I get w_1, w_3 and this fine w_4 is that ok? So, therefore, what I get is Q or the matrix Q is nothing, but look at. So, I think I should write somewhere here.

So, Q is $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 & 0 & 0 & 1 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & -1 \end{bmatrix}$ that is the first vector; second vector is $\frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 1 \\ 0 \\ 1 \end{bmatrix}$ and the third vector w_3 is $\frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ -1 \\ 0 \\ 1 \end{bmatrix}$ and the fourth vector is $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 0 & -1 \\ 0 \end{bmatrix}$. This is what Q is. I need an R here and I have an A here.

A is given to be equal to $\begin{bmatrix} 1 & 0 & 1 & 0 & 0 & 1 & 0 & 1 & 1 \\ -1 & 1 & 1 & 2 & 1 & 1 & 1 \end{bmatrix}$ alright. So, to get the value of R as I said these are orthonormal. So, you just have to look at inner product of Q the first column with the first column here and so on, alright. So, if you look at the dot product here it is $\sqrt{2}$ for u alright, fine. So, look at $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 0 \\ 1 \end{bmatrix} \cdot \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 0 \\ 1 \end{bmatrix}$. So, you get $\sqrt{2}$.

So, this entry is $\sqrt{2}$ and since I am looking at Gram–Schmidt process where the linear span remains the same till the i -th stage. So, I get this as 0 here there is no contribution from the second third and fourth column fine. Now, if I want to look at the second entry here, I will have to look at inner product of this with the second 1 and this with the second one. So, this with the second one is already 0; this only this one which is playing the role.

So, is nothing, but $0 \sqrt{2} \begin{bmatrix} 0 \\ 0 \end{bmatrix}$. Similarly, let us look at now the third one. So, I have to look at the inner product of this with this one. Inner product of this with this one is $\frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 0 \\ 1 \end{bmatrix} \cdot \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 1 \\ 0 \\ 1 \end{bmatrix}$ which is $\sqrt{2}$. Inner product of the second vector that is w_2 with u_3 is already 0. This what we had seen. So, this part will be 0, fine. Similarly I would like you to see that this is 0 here, 0 here. Fourth one – let us look at the fourth one.

(Refer Slide Time: 09:11)

Handwritten mathematical derivation on a digital whiteboard:

Top row: $u_1 = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}, u_2 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}, u_3 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix}, u_4 = \frac{1}{\sqrt{2}} \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$

Second row: $v_3 = u_3 - \langle u_3, u_1 \rangle u_1 - \langle u_3, u_2 \rangle u_2$

Third row: $= \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} - \frac{0}{2} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} - 0 = \begin{bmatrix} 0 \\ -1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 1 \\ -1 \end{bmatrix}$

Fourth row: $v_4 = \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix} - \langle v_4, u_1 \rangle u_1 - \langle v_4, u_2 \rangle u_2 - \langle v_4, u_3 \rangle u_3 = \begin{bmatrix} 2 \\ 1 \\ 1 \end{bmatrix} - \frac{3}{2} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} - \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \\ 1 \end{bmatrix}$

Fifth row: $= (2, 1, 1)^T - (3/2, 0, 0)^T - (0, 1, 0)^T = (1/2, 0, 1)^T$

Matrix decomposition:

$$A = \begin{bmatrix} 1 & 0 & 1 & 2 \\ 0 & 1 & -1 & 1 \\ 1 & 0 & 1 & 1 \\ 0 & 1 & 1 & 1 \end{bmatrix} = \begin{bmatrix} 1/\sqrt{2} & 0 & 0 & 1/\sqrt{2} \\ 0 & 1/\sqrt{2} & -1/\sqrt{2} & 0 \\ 1/\sqrt{2} & 0 & 0 & -1/\sqrt{2} \\ 0 & 1/\sqrt{2} & 1/\sqrt{2} & 0 \end{bmatrix} \begin{bmatrix} \sqrt{2} & 0 & \sqrt{2} & 3/\sqrt{2} \\ 0 & \sqrt{2} & 0 & \sqrt{2} \\ 0 & 0 & \sqrt{2} & 0 \\ 0 & 0 & 0 & 1/\sqrt{2} \end{bmatrix}$$

Labels: A (matrix), Q (orthogonal matrix), R (upper triangular matrix)

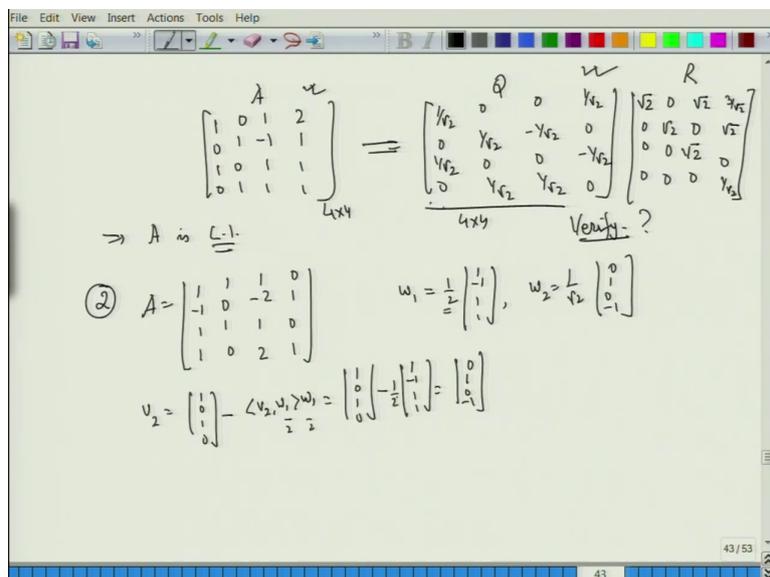

Bottom row: $\langle u_4, u_1 \rangle =$

Page number: 43/53

So, fourth one has lot of entries. So, be careful. So, I have to compute fourth one this is a fourth one. So, u_4 inner product with w_1 ; so, with w_1 the inner product of this is $2 \ 0 \ 1$; so, 2 plus 1 , 3 upon root 2 alright. So, it is going to be I am looking at this. So, this into this should be 3 upon root 2 , 2 plus 1 did I write it correctly. I think I have written it wrongly there.

So, it should be 3 upon root 2 here fine. This with this one will give me $2 \ 1 \ 0$ root 2 should give me root 2 , fine. So, basically you have to compute things this with this will give me 0 minus root 2 0 minus here. So, that goes off this is 2 plus 1 . So, it is 1 upon root 3 here, fine. So, 1 upon root 2 just look at it $2 \ 0 \ 1$. So, 2 upon root 2 and 1 upon root 2 is 1 upon root $2 \ 0$ alright.

(Refer Slide Time: 10:15)

So, verify I may have done mistake as verify it because my notes show something else. So, I am sure that I have done a mistake. So, verify it alright very very important verification alright. You have to do that. So, what you have seen here is that here A I have got a Q which is 4 cross 4. This Q is also 4 cross 4 and therefore, this implies that A is linearly independent. This implies A is linearly independent, fine.

So, it gives me linear independence as well as a matrix which is orthonormal, Q is orthonormal and I have got the matrix Q fine. Let us look at another example slight change. So, example 2; I take A as 1 minus 1 1 1 1 0 1 minus 2 1 2 0 1 0 1. So, again I have got four of them – first, second, third, fourth alright. We will see what we need we want Q and R again, alright.

So, for me w_1 will be equal to $1 + 1 + 2 + 3 + 1 + 4$. So, 1 upon 2 times 1 minus $1 + 1 + 1$. If I look at these two alright these two they are not perpendicular. So, I will have to compute v_2 . So, v_2 is $1 + 0 + 1 + 0$ minus dot product of these two which is $1 + 1 + 2$ basically with this w_1 . So, v_2 w_1 w_1 which is equal to $1 + 0 + 1 + 0$ minus this with this is $1 + 1 + 1 + 2$ upon 2 is 1 .

So, it is 1 minus $1 + 1 + 1$ which is 1 minus $1 + 1 + 1$ is $0 + 1 + 1$ minus $1 + 1 + 1$ is 0 and this is minus 1 . So, w_2 is 1 upon $\sqrt{2}$ times $0 + 1 + 0$ minus 1 . I hope I am doing correctly because as I said I am good at it no I have got something else here in my notes v_2 is $1 + 0 + 1 + 0$, yes. So, I get v_2 as $1 + 1 + 1$ minus 1 . So, where is the mistake? So, this with this I have to do v_2 with w_1 .

So, 1 here 1 here; there will be 1 upon 4 here. See w_2 1 is a 2 here. So, there will be a 2 coming here 2 coming here. So, it will be 1 upon 4 . So, it should be half here alright. So, as I said I am good at mistakes. So, I may have done similar mistake earlier also. So, be careful.

(Refer Slide Time: 13:01)

The image shows a digital whiteboard with handwritten mathematical work. At the top, it says "A is C-1" with "4x4" written above it. Below this, a matrix A is defined as:

$$A = \begin{pmatrix} 1 & 1 & -2 & 0 \\ -1 & 0 & 1 & 1 \\ 1 & 1 & 1 & 0 \\ 1 & 0 & 2 & 1 \end{pmatrix}$$

Two vectors w_1 and w_2 are given as:

$$w_1 = \frac{1}{2} \begin{pmatrix} -1 \\ 1 \\ 1 \\ 1 \end{pmatrix}, \quad w_2 = \frac{1}{2} \begin{pmatrix} 1 \\ 1 \\ 1 \\ -1 \end{pmatrix}$$

There are arrows pointing from the matrix A to the vectors w_1 and w_2 with the labels "1+2+1+2" and "1-2+1-2" respectively. The word "Verify?" is written to the right. Below the vectors, the dot product $\langle v_2, w_1 \rangle$ is calculated as:

$$\langle v_2, w_1 \rangle = \begin{pmatrix} 1 \\ 0 \\ 1 \\ 0 \end{pmatrix} \cdot \begin{pmatrix} -1/2 \\ 1/2 \\ 1/2 \\ 1/2 \end{pmatrix} = \begin{pmatrix} -1/2 \\ 1/2 \\ 1/2 \\ -1/2 \end{pmatrix}$$

Then, the dot product $\langle v_3, w_1 \rangle$ and $\langle v_3, w_2 \rangle$ are calculated, resulting in $(0, 0, 0, 0)$. At the bottom, there are two equations:

$$\langle (1, -2, 1, 2), (1, -1, 1, 1) \rangle = \frac{(1, -1, 1, 1)}{4}$$

$$1 + 2 + 1 + 2 = 3/2$$

$$-2 + 3/2 + 1/2 = 0 \quad 1 - 3/2 + 1/2$$

$$2 - 3/2 - 1/2 = 0$$

The whiteboard interface includes a menu bar at the top (File, Edit, View, Insert, Actions, Tools, Help) and a status bar at the bottom showing "43/53".

So, it is 1 minus half is half 0 minus minus plus is half 1 minus half is half and 1 minus 0 minus half is minus half alright, fine. Now, it is correct now. So, w 2 here is again. So, it is 1 1 1 minus 1. So, it will be 1 upon 2 times 1 1 1 minus 1 alright. So, this time my notes are correct I think. So, I have got this here, fine. So, I have got w 2.

Let us get w 3. So, I have to go to v 3 v 3 is 1 minus 2 1 2 minus v 3 with w 1 w 1 and v 3 with w 2 w 2 which is equal to 1 minus 2 1 2 minus this with this will give me. So, let us do this part 1. So, I am good at mistakes. So, let me do it I think 1 into 1 is 1, minus 2 and minus 1 is plus 2, 1 plus 1 is 1 and 2 here; so, 2 4 6, 6 upon 4 times 1 minus 1 1 1, fine.

With w 2 if I see it is 1 here minus 2 here. So, 1 minus 2 1 minus 2 plus 1 and 2 minus 2 here; so, 1 plus 1 is 2 2 minus 2 is 0; so, minus 2 upon 4 of 1 1 1 minus 1. So, this turns out to be I

have written it as $0 \ 1 \ 0 \ 1$. So, let us see. So, this will cancel out. I get 3 upon 2 here, this will give me half.

So, I have got $1 \text{ minus } 2 \ 1 \ 2 \text{ minus of } 3 \text{ upon } 2 \text{ minus minus plus } 3 \text{ upon } 2$. So, with a minus sign here, then it is $3 \text{ upon } 2$ and $3 \text{ upon } 2 \text{ minus half half half minus half}$ and this is equal to $1 \text{ minus } 3 \text{ by } 2$ and minus half that is minus 1 I think I get here minus 2 plus. So, it is plus 3 by 2. So, it will again be half.

So, I think there is some mistake I think again $1 \text{ minus } 3 \text{ by } 2 \text{ minus half}$ I am getting here and my note says something else. So, let me do it again I think as usual. So, I wrote it correctly I think $1 \text{ minus } 2 \ 1 \ 2$, fine. So, I have to look at inner product of $1 \text{ minus } 2 \ 1 \ 2$ inner product with $1 \text{ minus } 1 \ 1 \ 1$ times $1 \text{ minus } 1 \ 1 \ 1$ divided by 4.

So, this is 1 here plus 2 plus 1 plus 2 which is 3 by 2. So, minus 3 by 2 I wrote here $1 \text{ minus } 1 \ 1 \text{ minus } 1$ I wrote it correctly this part the other part was $v \ 3$ with this. So, it is $1 \ 1 \ 1$. So, $1 \text{ minus } 2 \ 1 \text{ minus } 2$, so, minus half; so, minus minus plus. So, there is a mistake here. It should have been plus here because there is a minus minus here. So, there is a minus 2 here. So, it should have been plus here alright.

So, therefore, there is a plus here. So, $1 \text{ minus } 3 \text{ by } 2$ and plus half is 0 fine. Then $1 \text{ minus minus plus } 3 \text{ by } 2$, $3 \text{ by } 2$ and plus here, fine. So, look at this $1 \text{ plus } 3 \text{ by } 2$ and plus half is that ok. So, it should be 2 here for me $3 \text{ by } 2 \text{ plus } 1$. So, sorry it will be 1 here. Then what am I doing? Let me write it $\text{minus } 2 \text{ plus } 3 \text{ by } 2 \text{ plus half}$ which is 0. Why did I write here 1 here?

Again some mistake is there I think $1 \ 1 \text{ minus } 1 \text{ half}$ I got it as minus 2. So, minus minus plus and half of half will come into play, that is $\text{minus } 3 \text{ by } 2 \ 1 \text{ minus } 1 \ 1 \ 1$ here $0 \ 1$. So, let us see what it is fine. So, $1 \text{ plus } 1 \text{ minus } 3 \text{ by } 2$ whatever it is $1 \text{ minus } 3 \text{ by } 2 \text{ plus half } 3 \text{ by } 2$. So, it is 0 here. So, check what it is this entry alright and $2 \text{ minus } 3 \text{ by } 2 \text{ minus half}$ which is 0 here. So, sorry it is 0. So, everything is 0 here alright. So, everything is 0. So, it means the calculation was correct fine my notes are correct it means.

(Refer Slide Time: 17:56)

$\rightarrow A$ is $\underline{C-1}$. 4×4 4×4 Verify-?

$(2) A = \begin{bmatrix} 1 & 1 & -2 & 0 \\ -1 & 0 & -2 & 1 \\ 1 & 1 & 1 & 0 \\ 1 & 0 & 2 & 1 \end{bmatrix}$

$w_1 = \frac{1}{\sqrt{2}} \begin{bmatrix} -1 \\ 1 \\ 1 \\ 1 \end{bmatrix}, w_2 = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 1 \\ -1 \\ -1 \end{bmatrix}, w_3 = \frac{1}{\sqrt{6}} \begin{bmatrix} 0 \\ 1 \\ 0 \\ 1 \end{bmatrix}$

$v_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} - \langle v_2, w_1 \rangle w_1 = \begin{bmatrix} 0 \\ 1 \\ 0 \\ 0 \end{bmatrix} - \left(\frac{1}{\sqrt{2}} \begin{bmatrix} -1 \\ 1 \\ 1 \\ 1 \end{bmatrix} \right) = \begin{bmatrix} 1 \\ 0 \\ -1 \\ -1 \end{bmatrix}$

$v_3 = \begin{bmatrix} 1 \\ -2 \\ 1 \\ 2 \end{bmatrix} - \langle v_3, w_1 \rangle w_1 - \langle v_3, w_2 \rangle w_2 = \begin{bmatrix} 1 \\ -2 \\ 1 \\ 2 \end{bmatrix} - \frac{1}{\sqrt{2}} \begin{bmatrix} -1 \\ 1 \\ 1 \\ 1 \end{bmatrix} - \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 1 \\ -1 \\ -1 \end{bmatrix} = \begin{bmatrix} 1 \\ -2 \\ 1 \\ 2 \end{bmatrix} - \begin{bmatrix} 1 \\ 0 \\ 2 \\ 2 \end{bmatrix} = \begin{bmatrix} 0 \\ -2 \\ -1 \\ 0 \end{bmatrix}$

$= (0, 0, 0, 0) \Rightarrow v_3 \in \text{LS}(w_1, w_2)$

$v_3 = \begin{bmatrix} 0 \\ 1 \\ 0 \\ 1 \end{bmatrix} - \langle u_4, w_1 \rangle w_1 - \langle u_4, w_2 \rangle w_2 = (0, 1, 0, 1)^T$

43 / 53

So, v_3 is 0 implies that u_3 belongs to linear span of w_1, w_2 , this what we will see also afterwards. So, I take the next vector as my v_3 as $0, 1, 0, 1$ minus. So, this was my u_4 . So, I am looking at u_4 here; u_4 with w_1 minus u_4 with w_2 and this gives me my notes says that this is equal to $0, 1, 0, 1$ transpose. So, I hope it is correct. So, I get that w_3 is $0, 1, 0, 1$ and then there is this. So, 1 upon $\sqrt{2}$ take care of this part. So, this is what my w_1 is. So, try that out yourself I think.

(Refer Slide Time: 18:48)

Generalized QR-algorithm

$$A = \begin{bmatrix} 1 & 1 & 1 & 0 \\ -1 & 0 & -2 & 1 \\ 1 & 1 & 1 & 0 \\ 1 & 0 & 2 & 1 \end{bmatrix}_{4 \times 4} = \begin{bmatrix} y_1 & y_2 & y_3 & y_4 \\ -y_2 & y_2 & y_3 & y_4 \\ y_2 & y_2 & 0 & y_4 \\ y_2 & -y_2 & y_4 & y_4 \end{bmatrix}_{4 \times 4} \begin{bmatrix} \sqrt{2} & 1 & 3 & 0 \\ 0 & 1 & -1 & 0 \\ 0 & 0 & 0 & \sqrt{2} \end{bmatrix}_{4 \times 3}$$

Rank(A) = 3

$Q^T Q = I$ verify.

upper triangular form.

Example: Determine the projection of $v = (1, 1, 1, 1)^T$ on $\text{Null}(A)$, where

$$A = [1 \ -1 \ 1 \ -1]_{4 \times 5}$$

So, what I get here is that I have the matrix A here, Q here, R here. So, Q for me is 1 upon 2 minus 1 upon 2 1 upon 2 1 upon 2; then it is 1 upon 2 1 upon 2 1 upon 2 minus 1 upon 2 0 1 upon root 2; 0 1 upon root 2 this what I have. A is already given to me that 1 minus 1 1 1 1 0 1 minus 2 1 2 0 1 0 1. So, I have to find this matrix Q. Again, look at the dot product of this and this and verify that this turns out to be 2 0 0 1 1 0 3 minus 1 0 and 0 0 root 2 alright.

So, please verify this yourself. So, what we are seeing here is that this is a 4 cross 4 matrix. This turns out to be a 4 cross 3 matrix and this is 3 cross 4, fine. So, this part tells me that the rank of A is 3 and I would like you to verify that Q transpose Q is identity just verify it verify alright. And, you can see that this matrix in general it is not upper triangular, but it has an upper triangular form. It has an upper triangular form, is that ok?

So, this is what you have. This what you have to be careful about that you should know how to do it and understand these ideas that even though I am looking at orthonormality and so on, at the back of my mind independence is always there. So, even if I have independent thing here in example 2 sorry, example 1 where it was linearly independent here I got Q which was of the same order as A there was no issue and similarly R was also of the same order or similar order you can say.

But, when it is dependent, then the vectors in Q become less the number of columns in Q become less that is equal to the rank and you do this, alright. So, this part that I had applied here is called the generalized QR algorithm QR algorithm and the previous one was the actual one, the QR algorithm. Is that ok? So let me write what exactly I did alright, fine or let me go to one more example and then I think I can end this and then look at general ideas alright.

The next thing that I would like to now understand is what was this question we did about projection; so, one example about projection example. So, determine the projection of v which is $1, 1, 1, 1$ transpose on null space of A where A is the matrix $1 \text{ minus } 1 \ 1 \text{ minus } 1 \ 1$ alright.

So, this matrix A is $1 \text{ cross } 5$ and I am supposed to look at the I think I should have written one more because it is have five components there should be five components here also fine. So, I have to look at the projection of this projection of v on A null space of A , is that ok? So, let us compute what is the null space of A and then proceed, is that ok? So, we will do it by a two method if I have time.

(Refer Slide Time: 22:39)

$A = [1 \ -1 \ 1 \ -1 \ 1]_{1 \times 5}$
 $x - y + z - w + u = 0$
 $x = \begin{bmatrix} y \\ z \\ w \\ u \end{bmatrix} = y \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix} + z \begin{bmatrix} -1 \\ 1 \\ 0 \\ 0 \end{bmatrix} + w \begin{bmatrix} 1 \\ 0 \\ 1 \\ 0 \end{bmatrix} + u \begin{bmatrix} -1 \\ 0 \\ 0 \\ 1 \end{bmatrix}$
 Normal vector of the Null(A) is already given
 $x = \begin{bmatrix} 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$
 A basis of Null(A) = $\left\{ \begin{bmatrix} 1 \\ 0 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 1 \\ 0 \\ 0 \end{bmatrix}, \begin{bmatrix} 1 \\ 0 \\ 1 \\ 0 \end{bmatrix}, \begin{bmatrix} -1 \\ 0 \\ 0 \\ 1 \end{bmatrix} \right\}$
 From here, construct an orthonormal basis of Null(A).
 $\text{Proj}_u \begin{bmatrix} 1 \\ 1 \\ 1 \\ 1 \\ 1 \end{bmatrix} = \frac{\langle v, u \rangle}{\|u\|^2} u = \frac{\langle (1,1,1,1,1), (1,-1,1,-1,1) \rangle}{\sqrt{5} \sqrt{5}} \begin{bmatrix} 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix} = \frac{1}{5} \begin{bmatrix} 1 \\ -1 \\ 1 \\ -1 \\ 1 \end{bmatrix}$

So, let us see. So, one is so, method 1 is look at what is null space. So, null space of A if I want to look at X belonging to R 5 such that AX is 0 this is the null space of A. So, this gives me x minus y plus z minus w plus u is 0. So, I am writing x as x y z w u I always do mistakes. So, I will do again a mistake. So, be careful.

So, what I get here is X is equal to x y z w u will be equal to X is minus X is y minus z plus w minus z plus w minus u; y remains as it is, z remains as it is w remains as u remains. So, from here what I get is y times 1 1 0 0 0 plus z times minus 1 0 1 0 0 plus w times 1 0 0 1 0 and plus u times minus 1 0 0 0 1, fine.

So, I have got a basis of the null space. So, a basis of null space of A is 1 1 0 0 0 minus 1 0 1 0 0 1 0 0 1 0 and minus 1 0 0 0 1 fine this is the basis of null space, fine that is one way of

going about it. We will see the use of this; from there we will get an orthonormal basis and then proceed. So, from here construct an orthonormal basis of null space of A, fine.

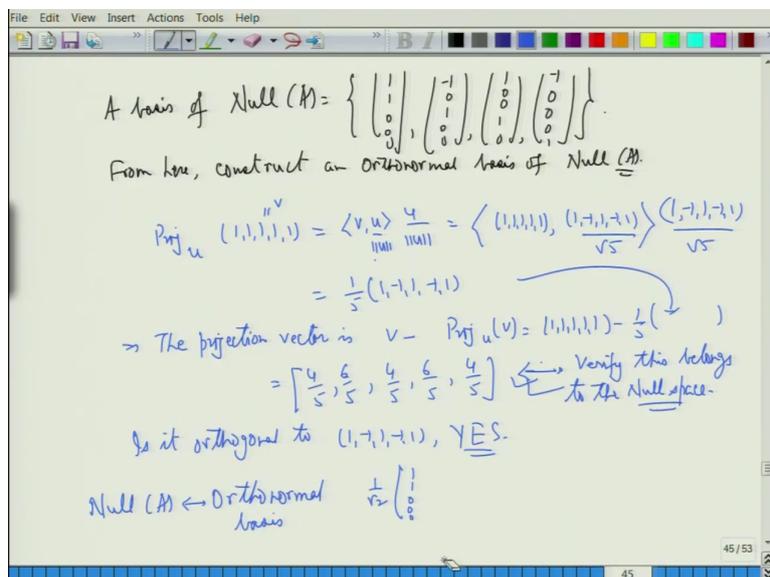

The other way is, so, as I said if you remember that I have this space with me. I have the vector v here; I am dropping a perpendicular here. So, this is 90 degree that I have. So, to get this vector w there are two ways – one is just look at the projection directly, the other way is compute this part alright. So, if I want to compute this part that is much easy for me because for this plane the null space of A alright there is only one vector which is perpendicular to it which is normal to it and there is already given to me alright.

So, the normal vector of this plane so, normal vector of the null space of A is already given alright. So, this vector this perpendicular vector the direction cosines of this is already given to me I can use this to get a projection onto this alright on this, fine on this vector and then subtract it that is another way of doing it. So, let us do that part first.

So, look at projection of the vector $1\ 1\ 1\ 1\ 1$ on this vector whatever that is A for me is, fine. So, not let me not write a here. So, whatever it is. So some vector which is let me write it as u fine. So, I want to look at this. So, this was if you remember this was nothing, but. So, this is my v . So, it is v comma u divided by length of u into u upon length of u , this is what I was supposed to do fine.

So, here if I look at this into this is give me $1\ 1\ 1\ 1\ 1$ minus $1\ 1\ 1\ 1\ 1$. So, it is 1 upon alright this is 1 upon something u was this is my u vector. So, the length of this vector is 5 . So, it is 1 upon. So, let me write I think otherwise there is always a confusion. So, I am writing here as $1\ 1\ 1\ 1\ 1$ with $1\ 1\ 1\ 1\ 1$ minus $1\ 1\ 1\ 1\ 1$ divided by root 5 into $1\ 1\ 1\ 1\ 1$ minus $1\ 1\ 1\ 1\ 1$ divided by root 5 which is equal to as I said 1 upon 5 times $1\ 1\ 1\ 1\ 1$ minus $1\ 1\ 1\ 1\ 1$ alright; this is what it is.

(Refer Slide Time: 27:06)

And, therefore, the vector that I am asking for the projection vector is the v minus this projection which is v was 1 1 1 1 1 minus 1 upon 5 times this vector whatever it is. And therefore, this turns out to be 1 minus 1 upon 5 is 4 upon 5 then 1 plus 5. So, 6 upon 5; then again 4 upon 5, 6 upon 5 and 4 upon 5, is that ok.

So, I would like you to see that this vector is indeed in the null space, so, alright. So, verify this belongs to the null space alright. So for verification what you are supposed to do? Just check whether this vector is perpendicular to this vector or not alright, fine. So, is this is it orthogonal to 1 minus 1 1 minus 1 1? Answer is yes. 12 minus 12 is 0, is that ok?

The other was look at the orthonormal basis of null space. So, I have computed that orthonormal basis null space of a orthonormal basis. So, orthonormal basis turns out to be

why did I write here 1 upon root 2 times 1 1 0 0 0 or you can do. So, no I will just because time is not there.

(Refer Slide Time: 28:57)

The image shows a digital whiteboard with handwritten mathematical work. At the top, there is a menu bar with 'File', 'Edit', 'View', 'Insert', 'Actions', 'Tools', and 'Help'. Below the menu is a toolbar with various drawing tools. The main content is handwritten in blue ink:

$$= \frac{1}{5}(1, -1, 1, 1)$$

→ The projection vector is $v = \text{Proj}_u(v) = (1, 1, 1, 1) - \frac{1}{5}(\rightarrow)$

$$= \left[\frac{4}{5}, \frac{6}{5}, \frac{4}{5}, \frac{6}{5} \right] \leftarrow \text{Verify this belongs to the Null space.}$$

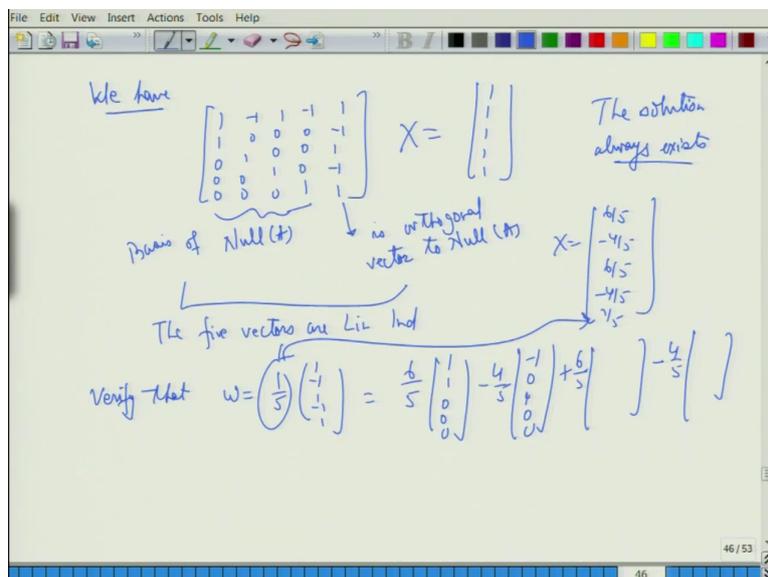

Is it orthogonal to $(1, -1, 1, 1)$, YES.

Null(A) ← Orthogonal basis Try out yourself and complete.

At the bottom right of the whiteboard, there is a small box containing '45/53' and a page number '45'.

So, try it out yourself try out yourself alright and complete. I will give you another idea which is also important. Therefore, I think I am asking you to do this.

(Refer Slide Time: 29:14)

The third idea is that we have null space of a the basis of null space of a as 1 1 0 0 0, another element was minus 1 1 and then 1 0 0 and that part minus 1, alright. So, I had minus 1 0 1 0 0 then I had 1 0 0 1 0 minus 1 0 0 0 1. So, this was about the null space of A and the vector that was given to me on which we will looking at things the null space was 1 minus 1 1 minus 1 1 alright.

So, if I look at this. So, this comes from the null space basis of null space of null space and this is orthogonal vector to null space of A or is it normal of it, alright. So, therefore, these five vectors, they are the five vectors are linearly independent alright. Since these are linearly independent, I can always solve the system this is equal to 1 1 1 1 1. So, the solution always exists the solution always exists alright.

So, I can solve it and it turns out that X is equal to. So, X turns out to be equal to $6 \mathbf{u}_5 - 4 \mathbf{u}_5 + 6 \mathbf{u}_5 - 4 \mathbf{u}_5 + \mathbf{u}_5$, this is what it turns out to be. So, I would like you to verify here. So, verify that w vector is already $1 \mathbf{u}_5 + 1 \mathbf{u}_1 - 1 \mathbf{u}_1$ and this $1 \mathbf{u}_5$ is coming as the last entry here.

This is also equal to $6 \mathbf{u}_5$ times the first vector minus $4 \mathbf{u}_5$ times the second vector, then plus $6 \mathbf{u}_5$ times the next vector and minus $4 \mathbf{u}_5$ the last vector is that ok. So, complete this argument yourself and verify. So, there are different ways of computing these things. I would like to try that out alright and learn it.
