**Vibration of a circular drum**

Welcome back, last video we have seen vibration of a string in one dimension. So basically it is a one dimension way equation we solved when the string is infinite length or semi-infinite length or finite length with boundary conditions and  $(0, 2\pi)$  conditions we have solved the vibration of the string problem. So we can also solve second order I mean we can also solve two dimension wave equation that is actually that models the vibration of a membrane or vibration of a drum. So we will just demonstrate this vibration of a drum problem over a circular domain.

(Refer Slide Time: 1:05)

So let us consider a drum which is like this which is circular so that we can use the polar coordinates polar coordinates  $r$  and  $\theta$  and also when you have the vibration so you can assume that is a radially symmetric that means so you have to give  $r$  and  $\theta$ , so this is a plane domain in this disk you have  $r$  and  $\theta$  so  $r$  is between  $0$  to big  $R$  and  $\theta$  is between  $0$  to  $2\pi$  so  $\theta$  is between  $0$  to  $2\pi$  so you can think of solutions that are not depending on  $\theta$ .

So that means if you know the solution on this line that means you know is very where it is same, so all along  $\theta$  that means so whatever the curve you have on this it will be repeated

everywhere for every theta. So that means something like circular shape of solutions so if you look for when you when the drum is in the vibrating mode that is what actually (1:59) assume that you can the vibration so that the displacement of a drum along is radially only it depends only radially.

So that means is a symmetric radially symmetric solutions its reasonable assumption so we will try to look solve second order wave equation over this domain circular domain 0 to circle circle of radius r that is the domain spatial domain and t is a time t is greater than 0 so we will try to see first what is the second order two dimensional wave equation.

(Refer Slide Time: 2:27)

2-dim wave equation:

$$u_{tt} - c^2(u_{xx} + u_{yy}) = 0, \quad (x,y) \in D_R, \quad t > 0$$

I.c:  $\left. \begin{array}{l} u(x,y,0) = f(x,y) \\ u_t(x,y,0) = g(x,y) \end{array} \right\}, \quad (x,y) \in D_R.$

Diagram: A circle representing the domain  $D_R$  with radius  $R$ . The boundary is labeled  $C_R$ . The angular coordinate is  $0 \leq \theta \leq 2\pi$ .

Partial differential equations-10-05-2017 - Windows Journal

$t > 0$

I.C:  $\left. \begin{aligned} u(x,y,0) &= f(x,y) \\ u_x(x,y,0) &= g(x,y) \end{aligned} \right\} (x,y) \in D_R$

B.C:  $u(x,y,t) = 0, \forall (x,y) \in C_R$

$x = r \cos \theta, \quad y = r \sin \theta, \quad r > 0, 0 \leq \theta \leq 2\pi$

Partial differential equations-10-05-2017 - Windows Journal

B.C:  $u(x,y,t) = 0, \forall (x,y) \in C_R$

$x = r \cos \theta, \quad y = r \sin \theta \Rightarrow r > 0, 0 \leq \theta \leq 2\pi$ . and  $r = \sqrt{x^2 + y^2}, \theta = \tan^{-1} \frac{y}{x}$

$r_x = \cos \theta, \quad r_y = \frac{1}{\sqrt{1 + \frac{y^2}{x^2}}} \cdot \frac{-y}{x} = -\frac{y}{x^2 + y^2} = -\frac{\sin \theta}{r}$

$u_x = u_r r_x + u_\theta \theta_x \Rightarrow \frac{\partial}{\partial x} = r_x \frac{\partial}{\partial r} + \theta_x \frac{\partial}{\partial \theta} = \cos \theta \frac{\partial}{\partial r} - \frac{\sin \theta}{r} \frac{\partial}{\partial \theta}$

Partial differential equations: 10-05-2017 - Windows Journal

$$u_x = u_x r_x + u_y \theta_x \Rightarrow \frac{\partial}{\partial x} = r_x \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta}$$

$$u_y = u_x r_y + u_y \theta_y \Rightarrow \frac{\partial}{\partial y} = \sin \theta \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta}$$

$$r_x = \cos \theta, \theta_x = \frac{1}{r} \frac{\partial}{\partial \theta}$$

$$u_{xx} = \frac{\partial}{\partial x} \frac{\partial u}{\partial x} = \left( \cos \theta \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \right) \left( \cos \theta u_r - \frac{\sin \theta}{r} u_\theta \right)$$

$$= \cos^2 \theta u_{rr} - \cos \theta \sin \theta \left( u_{r\theta} \frac{1}{r} - \frac{1}{r^2} u_\theta \right) - \frac{\sin \theta}{r} \left( \cos \theta u_{r\theta} - \sin \theta u_{\theta\theta} \right) + \frac{\sin^2 \theta}{r^2} u_{\theta\theta}$$

$$u_{xx} = \cos^2 \theta u_{rr} - \frac{\sin 2\theta}{r} u_{r\theta} + \frac{1}{r^2} u_\theta \cos \theta \sin \theta + \frac{\sin^2 \theta}{r} u_{r\theta} + \frac{\sin^2 \theta}{r^2} u_{\theta\theta}$$

$$u_{yy} = \frac{\partial}{\partial y} \frac{\partial u}{\partial y} = \left( \sin \theta \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \right) \left( \sin \theta u_r + \frac{\cos \theta}{r} u_\theta \right)$$

$$= \sin^2 \theta u_{rr} + \sin \theta \cos \theta \left( \frac{u_{r\theta}}{r} - \frac{1}{r^2} u_\theta \right) + \frac{\cos \theta}{r} \left( \cos \theta u_{r\theta} + \sin \theta u_{\theta\theta} \right) + \frac{\cos \theta}{r^2} \left( u_\theta \cos \theta - \sin \theta u_\theta \right)$$

$$u_{yy} = \sin^2 \theta u_{rr} -$$

Partial differential equations: 10-05-2017 - Windows Journal

$$u_{xx} = \cos^2 \theta u_{rr} - \frac{\sin 2\theta}{r} u_{r\theta} + \frac{1}{r^2} u_\theta \cos \theta \sin \theta + \frac{\sin^2 \theta}{r} u_{r\theta} + \frac{\sin^2 \theta}{r^2} u_{\theta\theta}$$

$$u_{yy} = \frac{\partial}{\partial y} \frac{\partial u}{\partial y} = \left( \sin \theta \frac{\partial}{\partial r} + \frac{\cos \theta}{r} \frac{\partial}{\partial \theta} \right) \left( \sin \theta u_r + \frac{\cos \theta}{r} u_\theta \right)$$

$$= \sin^2 \theta u_{rr} + \sin \theta \cos \theta \left( \frac{u_{r\theta}}{r} - \frac{1}{r^2} u_\theta \right) + \frac{\cos \theta}{r} \left( \cos \theta u_{r\theta} + \sin \theta u_{\theta\theta} \right) + \frac{\cos \theta}{r^2} \left( u_\theta \cos \theta - \sin \theta u_\theta \right)$$

$$u_{yy} = \sin^2 \theta u_{rr} + \frac{\sin 2\theta}{r} u_{r\theta} - \frac{1}{r^2} u_\theta \cos \theta \sin \theta + \frac{\cos^2 \theta}{r} u_{r\theta} + \frac{\cos^2 \theta}{r^2} u_{\theta\theta} - \frac{\cos \theta \sin \theta}{r^2} u_\theta$$

$$u_{xx} + u_{yy} = u_{rr} + \frac{u_r}{r} + \frac{u_{\theta\theta}}{r^2}$$

So two dimensional so wave equation so this is as usual is same so  $u_{tt} - C^2 u_{xx}$  so this is for the string now because it is involved two spatial dimensions so what you have is to  $u_{yy}$  equal to 0 so  $xy$  belongs to this is if I include every region inside this disk that is we call this  $D_r$  as a disk and this circle is called  $C_r$  I call it  $C_r$  so you have this belongs to  $D_r$ , okay.

So this is what is this and  $t$  belongs to  $t$  greater than 0, so this is the domain so this is your two dimensional wave equation. Now if you give the velocity of this drum vibration at  $t$  equal to 0 so that is velocity and displacement of the drum that is our initial conditions initial conditions are  $u$  at  $x_0, x, y, 0$  this is equal to some function of  $x, y$ . Similarly the velocity of the drum  $x, y, 0$  is some  $g$  of  $x, y$  so this is what you have for all  $x, y$  belongs to  $x, y$  belongs to  $D_r$  so this is the

initial condition that is what is known, so  $t$  equal to 0 you have the initial data and you have the boundary data that is on the boundary you have this drum that is that means normally so  $u$  at  $x$  equal to so what happens on the  $C_r$ , so  $u$  at  $x, y$  and  $t$  equal to 0 for every  $x, y$  belongs to  $C_r$  so this is what it means.

So once you fix the all along the boundary so assume that the displacement of the drum or membrane is not 0 so that means it is not vibrating it is fixed. So this is the problem so this is a boundary value problem you want to solve because you are solving over this circular domain we can reduce this equation into polar coordinates in polar coordinates so when you have the polar coordinates  $x, y$  equal to  $r \cos \theta, r \sin \theta$  so we want to reduce the spatial variables into this polar variables  $r$  and  $\theta$ . So you have this you have  $r$  is positive and  $\theta$  is between 0 to  $2\pi$  so that is what we have. So once you have this  $x$  and  $y$  you have this is the one and what you need is  $u_{xx}$  and  $u_{yy}$  so to start with  $u_x$ , so  $u_x$  is so  $u$  is a function of  $x, y, t$  so for the time being you ignore  $t$  so all you are changing only  $x, y$  to  $r$  and  $\theta$ .

So  $x, y$  if you replace  $r \cos \theta, r \sin \theta$   $u$  of  $x, y, t$  becomes  $u$  of  $r, \theta$  and  $t$  so if you want  $u_x$  then you have to differentiate with this respect to  $r$  and  $r_x$  plus  $u_\theta \theta_x$  that is what is your  $u_x$ , okay. And also there is another variable that is  $u_t$  into  $t$  of  $x$  so  $t$  is independent from the spatial variables so that is 0, so that is why this is  $u_x$  is this. So immediately you have the domain so  $\frac{d}{dx} \frac{d}{dx} x$  is equal to  $r \frac{d}{dr} \frac{d}{dr} r$  plus  $\frac{d}{d\theta} \frac{d}{d\theta} \theta$  so if you apply  $u$   $\frac{d}{dx} u$  by  $\frac{d}{dx} x$  is that is what it is (( )) (6:31) you can get this.

So from this we can also get  $r$  is this and you can get  $r$  equal to square root of  $x^2$  plus  $y^2$  square under root and  $\theta$  is  $\tan^{-1} \frac{y}{x}$ , okay so simply divide it  $y$  by  $x$  will give you  $r \tan \theta$  so  $r$  goes so that is simply  $\tan \theta$  so  $\tan^{-1} \frac{y}{x}$  is  $\theta$ . So we can calculate your  $r_x$  and  $t$  so  $r_x$  and  $\theta_x$  so this will give you  $r_x$  as what we get  $\frac{1}{r} \frac{x}{r}$  by  $\frac{1}{2}$   $r$  into  $r_x$  with respect to  $x$  you have  $2x^2, 2$  goes so basically  $x$  by  $r_x$  is  $r \cos \theta$  so is basically  $r \cos \theta$  by  $r$  that is  $\cos \theta$ , and you can also get  $\theta_x$  as  $\frac{1}{1+y^2/x^2}$  plus  $y$  square by  $x$  square  $\frac{d}{dx} \frac{y}{x}$  is  $-\frac{y}{x^2}$ .

So this  $x^2 - y^2$  goes that means you have  $-\frac{y}{r^2}$ . So  $y$  is  $r \sin \theta$  so you have  $-\sin \theta$  by  $r$ , so you can write this as  $\cos \theta \frac{d}{dr} r - \sin \theta$  by  $r$

dough dough theta so that is what is your dough dough x. So now you can write your  $u_{xx}$  in the same way you can also write  $u_y$ ,  $u_y$  is  $u_r r_y$  plus  $u_\theta \theta_y$  so this gives me dough dough y as  $r_y$ , what is  $r_y$ ?  $r_y$  is you can also get  $r_y$  so  $r_y$  is  $r$  is square root of  $x^2 + y^2$  so  $r_y$  is again you can see that  $r$  that will be  $\sin \theta$ .

So  $1$  by  $2$  square root of  $x^2 + y^2$  into  $2y$  so that is  $2$ ,  $2$  goes  $y$  by  $r$  so  $y$  is our  $\sin \theta$  by  $r$  so that is  $\sin \theta$ . So you have  $r_y$  is  $\sin \theta$  dough dough  $r$  and you can also get  $\theta_y$   $\theta_y$  is simply  $1$  by  $1$  plus  $\pi^2$  by  $x^2$   $d dx$  of  $d dy$  of  $y$  by  $x$  is simply  $1$  by  $x$  so that will give me  $x$  by  $r^2$ , so we have  $\cos \theta$  by  $r$  so you have  $\cos \theta$  by  $r$  into dough  $d \theta$  dough dough  $\theta$  is my dough dough  $y$ .

So now you can get your  $u_{xx}$  that is dough dough  $x$  of dough  $u$  by dough  $x$ , so dough dough  $x$  now I can get it from here, okay so this is from dough dough  $x$  you have  $\cos \theta$  dough dough  $r$  minus  $\sin \theta$  by  $r$  dough dough  $\theta$  into dough  $u$  by dough  $x$  is from here so you can get it from so dough that is also simply so the same thing you operate on  $u$  you get  $\cos \theta$   $u_r$  minus  $\sin \theta$  by  $r$   $u_\theta$ .

So now  $\cos \theta$  is common so  $\cos \theta$  now dough dough  $r$  you operate on to this function, so you have so  $\cos \theta$   $\cos^2 \theta$  so dough dough  $r$  of  $\cos \theta$  this is our two functions, one function, second functions so this is a function of  $\theta$  so this is  $0$  plus so  $\cos \theta$  into  $u_r$  so  $\cos \theta$   $\cos \theta$   $\cos^2 \theta$   $u_r$ , then minus you have a  $\cos \theta$   $\sin \theta$   $\cos \theta$  into  $\sin \theta$  what you have is you have to differentiate with respect to  $r$  which is  $1$  by  $r$  into  $u_\theta$  so you have  $u_\theta$  is also common so this is a function of  $\theta$  so  $u$  is a function of  $r$  also so you have you have to differentiate with respect to  $r$  as  $u_\theta$  by  $r$  so you have  $u_\theta r$  into  $1$  by  $r$  minus  $1$  by  $r^2$  that is a derivative of  $1$  by  $r$ , so minus minus plus so that will be plus anyway so that minus I have already taken so your only differentiating with respect to  $1$  by  $r$   $u_\theta$  by  $r$  so and you do that this what we have so into you  $\theta$ , okay.

Then now you consider this part so this you add  $\theta$  on here so you have a minus  $\sin \theta$  by  $r$  dough dough  $\theta$  of so  $u_r$  so now you have to differentiate with respect to  $\theta$  for this function of  $xy$  so you have a  $u_r \theta$   $\cos \theta$  plus  $\cos \theta$  is if you differentiate that will be minus  $\sin \theta$  and  $u_r$  into  $u_r$ , so that is what is this one and minus minus plus now you are acting on this this one so you have  $\sin^2 \theta$  by  $r^2$   $u_\theta$   $\theta$ .

Now that is my  $u_{xx}$  so you have  $u_{xx}$  as  $\cos^2 \theta \frac{u}{r} - \frac{1}{r} \frac{u}{r} \frac{\partial}{\partial r}$  and  $\frac{1}{r} \frac{u}{r} \frac{\partial}{\partial r}$  so this one this one together so you have so that will be  $\sin \theta \cos \theta \frac{u}{r}$  into  $\frac{u}{r}$ ,  $\frac{u}{r} \frac{\partial}{\partial r}$  and  $\frac{u}{r} \frac{\partial}{\partial r}$  both are same so you have  $\sin^2 \theta \frac{u}{r} - \frac{1}{r} \frac{u}{r} \frac{\partial}{\partial r}$  becomes that by  $\frac{u}{r} \frac{\partial}{\partial r}$  is what is become these two terms and what you get is this one plus  $\frac{1}{r^2} u \cos \theta \sin \theta$ , okay  $\cos \theta \sin \theta$  and that is what is this one  $\frac{1}{r^2} u \cos \theta \sin \theta$  minus plus now this one you have plus  $\sin^2 \theta \frac{u}{r}$  plus  $\sin^2 \theta \frac{u}{r}$  this is my  $u_{xx}$  you calculate similarly  $u_{yy}$  so that is dough dough  $y$  of dough you by dough  $y$  so again you do the same thing so if you do this one here dough dough  $y$  is  $\sin \theta$  dough dough  $r$  plus  $\cos \theta$  by  $r$  dough dough  $\theta$  acting on  $\sin \theta$  you have  $\frac{u}{r}$  plus  $\cos \theta$  by  $r \frac{u}{r}$ .

So if you actually do this  $\sin^2 \theta \frac{u}{r}$  and this will be if you that is what is the if you add this on this term, so and this term this term if you do plus  $\sin \theta \cos \theta$  that is the common and you are differentiating this  $\frac{u}{r} \frac{\partial}{\partial r}$  with  $\theta$ . So  $\frac{u}{r} \frac{\partial}{\partial r}$  by  $r$  minus  $\frac{1}{r^2} u$  you  $\frac{\partial}{\partial r}$  and that is what is the this derivative now you add this one on each of this you have  $\sin \theta \cos \theta$  so you have  $\cos \theta$  by  $r$  and if you differentiate this this will be  $\cos \theta \frac{u}{r}$  plus  $\sin \theta \frac{u}{r}$ .

And now if you do this one here so you have  $\cos^2 \theta \frac{u}{r}$  so  $\cos \theta$  by  $r$ ,  $r$  comes out  $r^2$  dough dough  $\theta$  of  $\cos \theta \frac{u}{r}$  into  $\cos \theta$  minus  $\sin \theta$  into  $\frac{u}{r}$ , so this is what you have so you finally get  $u_{yy}$  as  $\sin^2 \theta \frac{u}{r} - \frac{1}{r^2} u \cos \theta \sin \theta$  and  $\sin \theta \cos \theta$  this term this mixed derivatives if you add this will be simply plus  $\sin^2 \theta \frac{u}{r}$  and what you have is minus  $\frac{1}{r^2} u \cos \theta \sin \theta$  and here  $\cos^2 \theta \frac{u}{r}$  and this will be  $\frac{u}{r} \frac{\partial}{\partial r}$  (15:40) so you have a  $\cos^2 \theta \frac{u}{r}$  you  $\frac{\partial}{\partial r}$  and here you have a minus  $\sin \theta \frac{u}{r}$  by minus  $\sin \theta \frac{u}{r}$  by  $r^2$ .

So this one and this one so you have a minus  $\frac{1}{r^2} u \cos \theta \sin \theta$  so I miss something so you have one more term here so you have this one if you dough dough  $x$  here when you operate this on to this you have one more term so that is minus minus so what you have here is  $\sin \theta$  by  $r^2$  dough dough  $\theta$  so you have a  $\frac{u}{r} \frac{\partial}{\partial r} \sin \theta$  plus  $\cos \theta \frac{u}{r}$  so this is what you have. So you have extra term that is  $\sin \theta$  by  $\cos \theta$  by  $r^2$   $\frac{u}{r}$ , so you have two terms here so this one and this one.

So similarly here you have our last term is here  $1$  by  $r$  square  $\cos \theta \sin \theta u_{\theta\theta}$ , so you can see now  $u_{xx} + u_{yy}$  is actually now if you combine this one and this one together you have  $u_{rr}$  now this gets cancelled if you add this and this gets cancelled and this one this together will give me plus  $ur$  by  $r$  and this will give me simply  $u_{\theta\theta}$  by  $r$  square, okay and this gets cancelled, so you have this gets cancelled, okay so these are the things will remain so this is what you have.

(Refer Slide Time: 17:32)

Handwritten mathematical derivation on a whiteboard:

$$\Rightarrow u_{tt} - c^2 \left( u_{rr} + \frac{u_r}{r} + \frac{u_{\theta\theta}}{r^2} \right) = 0, \quad 0 < r < R, \quad 0 \leq \theta \leq 2\pi$$

$t > 0 \quad (\because u(r, \theta, t))$

For radially symmetric vibrations,  $u(r, \theta, t) = u(r, t)$ .

$$\Rightarrow u_{tt} - c^2 \left( u_{rr} + \frac{1}{r} u_r \right) = 0, \quad 0 < r < R, \quad t > 0$$

I.C:  $\left. \begin{aligned} u(r, 0) &= f(r) \\ u_t(r, 0) &= g(r) \end{aligned} \right\} 0 < r < R$

B.C:  $u(R, t) = 0$

Handwritten mathematical derivation on a whiteboard:

$$\Rightarrow \left\{ \begin{aligned} &u_{tt} - c^2 \left( u_{rr} + \frac{1}{r} u_r \right) = 0, \quad 0 < r < R, \\ &t > 0 \\ &\text{I.C: } \left. \begin{aligned} u(r, 0) &= f(r) \\ u_t(r, 0) &= g(r) \end{aligned} \right\} 0 < r < R \\ &\text{B.C: } u(R, t) = 0 \end{aligned} \right.$$

So now the wave equation becomes  $u_{tt} = C^2 u_{rr} + \frac{u_r}{r} + \frac{u_{\theta\theta}}{r^2}$  equal to 0 this is now from  $r$  is now if you take  $xy$  belongs to  $r$  so  $0$  is between  $r$  to  $r$  theta so

theta is between 0 to 2 pi and t is positive so these are the three variables you have u is a function of u is a function of r theta and t since u is this one so, okay so is function of r theta t. So now if you consider drum will radially symmetric for radially symmetric for radially symmetric vibrations u is u of r theta t should be it depend on theta so that means u depends only on r and t.

So if you do that this is 0 so what you have is the equation becomes  $utt - C^2 \text{urrr} + 1$  by r ur equal to 0. So now you have the domain is between 0 to r and theta is anyway so it is independent so you have theta t is positive. So you have two variables u is only a function of r and t now what happens to the initial conditions now this is a equation you have the initial conditions u at x, y, 0 so at t equal to 0 for all r so ur 0 equal to f of r and r is between 0 to r.

Similarly ut at r0 is g of r, okay so this is what you have for 0 r is between 0 to r. And boundary conditions of the drum so you have you fixed it so this becomes this is a capital R that is the boundary of the drum so that is for all times 0 so it is fixed. So this is the boundary value problem you want to solve by separation of variables. So let so let us let us use a separation of variables like we did earlier so the main purpose of main purpose of solving this two dimensional wave equation in this domain is to extract this Sturm liouville problem for the Bessel equation that you have learnt Sturm liouville theory in the ordinary differential equations in earlier videos, okay.

So let us solve so solution is for this problem you consider u of let the solution be a separation of variables so you have r, t you consider like F of r capital F and G of t which is non-zero. So if you look for the solution as a non-zero solution you substitute the equations what we have is F of r G double dash of t equal to actually C square and urr that is F double dash of r plus 1 by r F dash of r into G of t so that is a common term both the cases because only r derivatives.

So this because this is non-zero you can divide it so that you can write G dash of t by G of t if you divide with f or G t and C square also you bring it here so you put it here which is equal to F dash of F double dash of r 1 by r F dash of r by Fr Gr so this is divide by F of r G of t G of t goes

so this is a function of  $t$  left hand side and the right hand side is a function of  $r$  so this should be constant in the separation of variables method.

So you have this  $\lambda$  is a parameter, okay so now we have so you if you consider this this is one ordinary differential equations so what you get is  $F''(r) + F'(r) - \lambda F(r) = 0$  this is one ODE another ODE is  $G''(t) - \lambda G(t) = 0$  so this is for  $t$  positive and this is actually for  $r$  is between  $0$  to capital  $R$ , so there are the two things.

Now you apply the boundary conditions so if you apply the boundary condition what you get is  $u(R, t) = 0$  will give me basically so  $F(R)G(t) = 0$  so  $G(t)$  cannot be  $0$  so implies because  $t$  is varying so implies  $F(R) = 0$  so this is your boundary condition this is your ordinary differential equation which is  $n$  which is already in this in the self-adjoint form so how do we see that it is self-adjoint form you have  $r$  into  $F''(r) + F'(r) - \lambda F(r) = 0$ , so this is the equation so this you can write it like  $F''(r) + F'(r) - \lambda F(r) = 0$ , so this is the equation so this you can write it like  $F''(r) + F'(r) - \lambda F(r) = 0$  so  $p(r) = r$   $P(r) = r^2$  so implies  $p'(r) = 2r$  so we have a  $q(r) = 0$  plus  $q(r) = F(r)$  that is  $0$  and you have  $\lambda$  times  $w$  is  $w$  of  $r$  is  $r$  into  $F(r)$  so this is what you have.

So immediately once you have the  $w$  in Sturm liouville you have we can define your  $\phi$  and  $\xi$  as a inner product as sorry dot product dot product you can write like this which is what is your domain, domain is between  $0$  to  $R$  capital  $R$  so you have  $0$  to capital  $R$  and you have the  $w$  is this that is the weight function  $r \phi(r) \xi(r) \bar{dr}$ , so this is what is your dot product from the Sturm liouville (( ))(24:07). So because in already in the self-adjoint form so all  $\lambda$  should be real so this implies a  $\lambda$  is real, so  $\lambda$  is real that means  $\lambda = 0$   $\lambda = -\mu^2$  or  $\lambda = \mu^2$  with  $\mu$  is positive that is the meaning of real so you can choose any of this cases so start with the  $\lambda = 0$  case.

So if you choose the equation becomes this equation becomes  $r F''(r) + F'(r) = 0$  it is  $F''(r) + F'(r) = 0$ . So this is actually your if you actually multiply you can multiply both sides  $r$  so that you can write  $r$  into this one so you can write you can rewrite this just multiply  $r$  so that  $\lambda = 0$  this is your equation. So this is like  $x^2 y'' + xy' = 0$  this is a kind of Euler (( ))(25:07) type equation.

So you can look for solutions  $F$  of  $r$  as  $r$  power  $m$ , so if you look for solutions like this so if you what you get is  $m$  into  $m$  minus  $1$  plus  $m$  equal to  $0$  so that will give me  $m$  square equal to  $0$ . So roots are  $m$  equal to  $0$  and  $0$  so you get general solution of that equation is  $F$  of  $r$  as  $c_1$  times  $r$  power  $0$  that is  $1$  plus  $c_2$  times because they are repeated roots  $r$  power  $0$  into  $\log r$  so you have a  $r$  power  $0$  as  $1$  you have  $\log r$ . So this is the solution if you apply the boundary condition that is  $F$  at capital  $R$  equal to  $0$  will give me  $c_1$  plus  $c_2 \log r$  equal to  $0$ , okay.

So this will give me  $c_1$  equal to minus  $c_2 \log r$  and also what happens at  $F$  at  $r$  equal to  $0$  though it is point of the drum but it is not in the domain of the differential equations so that  $r$  as  $r$  goes to  $0$  that is  $F$  at  $0$  has to be so you cannot have so  $u$  of since  $u$  of  $r$  that is the displacement of this thing that is you look for  $F$  into  $G$  of  $t$  for all times you cannot have  $u$  at  $0$   $t$  that is  $f$  of  $0$  that is the displacement, okay  $F$  of  $0$  into  $G$  of  $t$  it has to be finite.

So if this has to be finite so  $F$  of  $0$  has to be finite, okay. So  $F$  of  $0$  is finite so that is the actually another boundary condition so we have given only one boundary condition here, okay. So one boundary condition is this you can also say and because  $r$  is the so  $r$  is a similar point you can give other boundary conditions, so boundary condition this is one boundary condition  $1$  and the other boundary condition is  $F$  at  $0$  and  $F$  dash of  $0$  because  $r$  equal to  $0$  is singular point are finite this is my second boundary condition for the Sturm Liouville problem.

So you have since  $F$  of  $0$  is finite as a second boundary condition you can see that  $\log r$  that is infinity so  $c_2$  has to be  $0$ , once  $c_2$  is  $0$  from this you can see that  $c_1$  is also  $0$ . So implies you have  $F$  is completely  $0$  for every  $r$  between  $0$  to  $r$  implies  $\lambda$  equal to  $0$  is not a eigen value, okay. So we have to see what happens if  $\lambda$  equal to  $\mu$  square other things, so  $\lambda$  equal to  $\mu$  square other things, so  $\lambda$  equal to  $\mu$  square let us consider so the equation becomes what happens if  $\lambda$  equal to  $\mu$  square if you put  $r$  double  $r$   $F$  double dash the equation is this plus  $F$  dash of  $r$  and what you have is minus  $\lambda$  equal to  $\mu$  square minus  $r$   $\mu$  square, so minus  $r$   $\mu$  square  $F$  of  $r$  equal to  $0$ , so this is what is the equation if you multiply  $r$  both sides you have  $r$  times this you have  $r$   $\mu$  square, okay.

So you bring in a new variable so this is actually something familiar equation but if you just use the if you change the independent variable  $r$  is the independent variable here so if you change this as a  $k$  so new independent variable  $k$  let  $k$  be  $r$  and  $\mu$ , so you try to change this so if you do

this  $F'$  of  $r$  so that is  $dF/dr$  you can write it like  $dF/dk$  into  $dk/dr$  that is  $1/\mu$ , okay. So  $dk/dr$  so this is equal to  $1/\mu$  times  $dF/dk$ .

So similarly you can see that  $d^2F/dr^2$  equal to  $\mu^2 d^2F/dk^2$ , so that is how you see so you can substitute  $r^2$ , so  $r^2$  is  $k^2/\mu^2$  that  $\mu^2$  goes so what you get is  $k^2 d^2F/dk^2$  plus similarly so you have  $k$  times  $dF/dk$  minus  $k^2 F$  of now  $F$  is a function of  $k$  now, okay. So just write  $F$ ,  $F$  is a function of  $k$  is equal to 0 where  $F$  is function of  $k$ , okay.

So  $F$  is a function of  $r$  after so once you replace  $r$  is actually so  $F$  is depending on  $r$ ,  $r$  is actually  $k/\mu$  so  $\mu$  is fixed  $k/\mu$  since  $r$  is  $k/\mu$  so is  $F$  of  $r$  is actually  $F$  of  $k/\mu$  so is basically some function of  $k/\mu$  is fixed, okay. So you can write if you want, okay so  $F$  is depending on  $k$  so you can say that  $F$  is as it is so  $F$  is depending on  $k$ . So this is the equation we are familiar with what is this equation this is the Bessel equation, okay. This is not Bessel equation this is something similar to Bessel equation Bessel equation is  $x^2 y'' + x y' + (x^2 - \alpha^2)y = 0$ .

So if  $\alpha = 0$  what you have is something similar but you have a minus  $x^2$ , okay. So let us choose  $\alpha = 0$  in the Bessel equation Bessel equation with  $\alpha = 0$  Bessel equation with  $\alpha = 0$ , okay if I want if I replace again do the same thing, so I tried to change let  $z$  be the new variable new independent variable instead of  $x$  here if you convert this as a  $z$  a new independent variable  $z$  is  $ix$  then you see that  $d^2y/dx^2$  which is in this equation becomes  $d^2y/dz^2$  into so simply start with like earlier  $dy/dx$ ,  $dy/dx$  is  $dy/dz$  into  $dz/dx$  that is  $i$ .

So you see that immediately  $d^2y/dx^2$  as  $d^2y/dz^2$  into  $i^2$  so that is minus  $i^2$ , so that is what you get. So you again  $ix^2$  is  $z^2/i^2$ ,  $i^2$  goes the equation becomes now simply  $z^2 y'' + z y' + (z^2 - \alpha^2)y = 0$  into  $dy/dz$  so these two terms will not change like here with this transformation plus  $x^2$  now I can write, so where is the equation? Yes, you can now write the equation plus  $x^2$ ,  $x^2$  becomes minus  $z^2$ , right?  $x^2$  is because  $x = iz$  so minus  $i^2 z^2$ , right? So what happens to minus  $ix^2$  equal to minus  $iz^2$  so  $x^2$  is simply minus  $z^2$   $y$  of  $z$  now is a function of  $z$  equal to 0.

So this is the Bessel this is called modified Bessel equation with alpha equal to 0. So with this transformation you see that the equation is modified so this equation is modified to something similar here this is exactly what you have here you have there. So we know that Bessel solutions are  $y$  at so Bessel solutions general solution of Bessel equation is the  $c_1 J_0$  of  $x$  plus  $c_2$  this is  $y_0$  of  $x$  when you have  $n$  equal to 0 when alpha is equal to 0 these are the two solutions  $y_0$  you will get a repeated roots if you use the (( ))(34:06) method you see that you get a repeated root if you look back into the videos of Bessel solutions when alpha is equal to 0 what you get is this is the general solution, okay.

And at  $x$  equal to 0  $r$  equal to 0 you want to have your solution to be bounded because of this boundary condition this boundary condition you can see that this cannot be 0. So the solution of this general solution of this equation the actual Bessel equation is if you say that if you want your at  $r$  if you want mounded this is what is the solution this is what is the function of  $x$  if you want function of  $z$  what is this is constant multiply of  $J_0$  of instead of  $x$  that is minus  $iz$  this is what you have.

So  $yz$  is actually  $J_0$  of  $iz$ , so if you write this  $J_0$ ,  $J_0$  of  $iz$  if you write  $J_0$  is  $c_1$  times  $J_0$  is  $m$  is from 0 to infinity so instead of what you have is (( ))(35:12). So you know the formula  $J$  not so that is now you have  $iz$  power two  $m$  divided by  $2$  power  $2 m$  into  $m$  factorial into  $m$  factorial actually square so that is what you get gamma of  $m$  plus 1 that is  $m$  factorial gamma of  $m$  plus 1  $m$  square. So this is what you get so you can see that minus 1 power  $m$  and minus  $i$  power  $2 m$ , okay that becomes 1.

So what you see is this is actually  $c_1$  times  $m$  is from 0 to infinity minus 1 power  $m$  into minus 1 power  $2 m$  so that is minus  $i$  square is minus 1 so power  $m$  so the whole term this minus  $iz$  minus  $i$  power  $2 m$  is actually equal to minus 1 power  $m$  this together with this becomes plus 1. So you have  $z$  power  $2 m$  divided by  $2$  power  $2 n$  by  $m$  factorial square so this is what is the equation. So the general solution of the Bessel equation and because with this transformation this is what you get. So that is this is exactly that modified Bessel equation is what we have here.

So the general solution is  $F$  of  $r$  instead of  $z$  you write  $F$  of instead of  $r$  you are writing a  $k$ , so you have a  $k$  so instead of  $z$  you are writing  $k$  so  $k$  is equal to  $c_1$  times this  $J_0$  so I will just simply write  $J_0$  of minus  $ik$  but  $J_0$  of minus  $k$  is this square and plus  $c_2$  of  $y_0$  of minus  $i$  of  $k$ ,

okay but at  $k$  equal to 0 this is not bounded, okay that we already know so has to be 0 so since  $y$  at  $F$  at 0 is bounded implies  $c_2$  is 0 so for that reason I cancel this.

So implies  $F$  of  $k$  is  $c_1$  times  $J_0$  of minus  $ik$ . Now we have another condition  $F$  of  $r$  equal to 0 so boundary condition 1 gives this implies  $F$  of  $r$  has to be 0. So that means  $c_1$  times  $J_0$  of minus  $i$  capital  $R$  has to be 0. So this implies  $c_1$  times what is  $J_0$  of minus  $iR$  you simply replace in this sum, so you have a summation  $m$  is from 0 to infinity  $z$  power that is  $R$  power  $2m$  divided by  $2$  power  $2m$  into  $m$  factorial square this has to be 0, but you see that each of this in this sum terms in this sum are positive  $R$  since capital  $R$  is positive so this implies  $c_1$  has to be 0 because this quantity is non-zero this is clearly term is positive this cannot be 0 so implies  $c_1$  is 0.

So you found  $c_2$  is 0 and  $c_1$  is 0 so finally you get  $F$  of  $k$  which is equal to completely 0, what is  $f$  of  $k$ ?  $F$  of  $k$  is the solution if  $F$  of the  $k$  is solution  $F$  of  $r$  is also so you can go back to your new terms so  $F$  of you can write your  $F$  of  $r$   $F$  of  $k$  is 0 implies  $F$  of  $r$  is also 0 for every  $r$  between 0 to  $R$ . So what is your domain  $F$  of  $k$  so once you have this because  $r$  is between 0 to  $r$   $k$  is between 0 to  $\mu R$  so that is what is the domain of this, okay.

So what you have to write is actually boundary condition becomes  $F$  of  $\mu R$   $F$  of  $\mu R$  equal to 0 so you have  $F$  of  $\mu R$  is 0, so  $F$  of  $\mu R$  is instead of you simply replace with  $\mu$  power  $2m$ , okay. So  $R \mu R$  equal to 0 so  $\mu R$  so this cannot be 0 because  $\mu$  is positive  $R$  is positive so it implies this so you have  $F_k$   $F_k$  is 0 and that implies  $F$  of  $r$  is also 0 in this domain  $F$  of  $k$  is 0 in the domain between 0 to  $\mu R$   $F$  of  $R$  is 0 that means  $F$  of  $r$  is 0 in this domain.

So that implies  $\mu^2 \lambda$  equal to  $\mu^2$  is not an eigen value, okay. So now we have we are left with only  $\lambda$  equal to minus  $\mu^2$  minus  $\mu^2$  if you see the equation becomes  $F''$  of  $r$  into  $r$  plus  $F'$  of  $r$  minus minus plus  $\mu^2$  into  $r$   $F$  of  $r$  equal to 0, okay. So if you multiply  $r$  both sides you get this and you have this. Now you change the variable so again use the same argument  $k$  equal to  $\mu r$  then change the independent where  $r$  to  $k$  so what you get is a  $k^2$   $F''$  of  $k$  plus  $k$  times  $F'$  of  $k$  plus  $k^2$   $F$  of  $k$  equal to 0.

So this is what is the equation now  $k$  is between 0 to  $\mu R$ , so this is what is the Bessel equation with Bessel equation from 0 to  $\mu R$  that is the domain this is your domain and this is a Bessel equation know the solution  $F$  of  $k$  which is equal to  $c_1 J_0$  of this is the Bessel equation with

alpha equal to 0, so you have  $J_0$  of  $k$  plus  $c_2$  general solution is this. So the general solution of general solution because this is the Bessel equation  $y'' + k^2 y = 0$ . So again you apply the boundary condition  $F$  at 0 has to be bounded implies  $c_2$  because  $y_0$  is unbounded at  $k$  equal to 0 so you have  $c_2$  has to be 0 so and now you apply now what happens your solution becomes  $c_1 J_0$  of  $k$ .

Now you apply first other boundary condition that is  $F$  at  $R$  has to be 0, so this means  $c_1 J_0$  of  $F$  at what is your boundary condition  $F$  at  $\mu R$  equal to 0, right?  $F$  at  $\mu R$  equal to 0  $F$  at  $R$  in this domain and because  $F$  at  $R$  is  $k$  by  $\mu$ , right?  $F$  at so  $\mu R$  so  $F$  at  $R$  is actually equal to  $F$  at  $R$  is  $k$  by  $\mu$  so  $F$  at capital  $R$  means equal to 0 implies  $F$  at  $k$  is actually  $k$  you have to replace with  $\mu R$  by  $\mu$  equal to  $FR$  which is 0.

So  $k$  the boundary is boundary condition becomes this one in this domain after the transformation. So  $c_1$  into  $J_0$  of  $\mu R$  equal to 0 and we know that  $J_0$  function has infinitely many 0's on the positive  $x$  axis so you call them  $\alpha_1$  or because we use yeah we can call this  $\alpha_1, \alpha_2, \alpha_3$  and so on. So you denote them as  $\alpha_3$   $\alpha$  and so on. So the roots of let  $\alpha_1, \alpha_2, \alpha_3$  and so on are the roots of infinite roots of  $J_0$  of  $x$  equal to 0 for  $x$  positive, okay.

So this is what you alphas are all in the positive side of the positive roots because this is defined, okay. We defined between 0 to this thing, so implies so what is your  $\mu$ ?  $\mu$  is now varying  $\mu$  is positive so  $\mu$  into  $R$  equal to  $\alpha_1$  if you consider you call them  $\mu_1$ . So you have so like that each  $\mu_i$  you denote that is corresponds to  $\alpha_i$ . So implies  $\mu_i$  equal to  $\alpha_i$  by  $R$  so  $i$  is running from 1, 2, 3 onwards whatever denoted  $\alpha_1, \alpha_2, \alpha_n$  and so on.

So this implies so for which so for these values of  $\mu$  you have  $J_0$  of  $\mu_i$  into  $R$  equal to 0 because this is nothing but  $J$  of  $\alpha_i$  these are the roots, okay. So that means  $c_1$  is that implies  $c_1$  is arbitrary you can take as 1. So you have a non-zero solution so this implies a solution is  $F$  of  $r$  equal to so  $F$  of  $k$  so solution the solution is solutions are eigen functions and they are and the non-zero solutions are non-zero you have to say specifically non-zero solutions that is when  $c_1$  is you take it as 1 and you take  $c_1$  equal to you have  $J_0$  of  $k$ , so  $J_0$  of  $k$   $k$  is what  $k$  is equal to  $\mu R$  so  $\mu_i$  into  $R$  so  $\mu_i$  so corresponds to this same  $\mu_i$  into  $R$  are eigen functions  $i$  is running from 1, 2, 3 onwards.

So this is how you find your  $F$  of  $R$ , okay. So  $F$  of  $R$  is  $F$  of  $k$  by  $\mu$ , okay  $F$  of  $k$  by  $\mu$  so  $F$  of  $k$  is so let us write what is this what are they are what are the solutions you have  $F$  of  $k$   $F$  of  $k$  equal to  $J$  not of  $k$ ,  $F$  of  $k$  as  $J$  not of  $k$ , okay. What is  $k$ ?  $k$  is  $\mu R$ , okay so what is  $F$  of  $R$ ?  $F$  of  $r$  you want  $F$  of  $r$ , right? So you want  $F$  of  $r$ , finally not  $F$  of  $k$ . So  $F$  of  $r$  is basically  $F$  of  $r$  equal to  $k$  by  $\mu$  so this is  $J_0$  of  $k$  is actually  $\mu$  into  $R$  so  $\mu$  into  $r$  so these are there solutions.

So you have you call them  $F_i$ ,  $F_i$  of  $r$  is okay so you write like this so  $F$  of  $k$  so these are your solutions  $F$  of  $k$  you call this  $F_i$   $F_i$   $J_0$  of  $i$ . So you have if you so far each  $\alpha$   $a$  for each  $\mu$   $i$  your  $F_i$  if you denote for each  $i$  you can define as  $F_i$  of  $k$  as  $J_0$  of  $\mu$   $i$  into  $r$ , okay. So  $J_0$  into  $r$  so this implies  $F$  so this is running  $i$  is running from 1, 2, 3 onwards. So and then you can write  $F_i$  of  $r$  as  $J_0$  of, what is  $\mu$   $i$ ?  $\mu$   $i$  is your  $\alpha$   $i$  by  $r$  into  $r$  so this is what you get 1, 2, 3 onwards. As a function of  $k$  they are  $J$  not of  $k$  that is  $k$  is  $\mu$   $r$ , so for each  $i$  so each  $i$  the solution is for each  $\mu$   $i$  you have  $J_0$  of  $\mu$   $r$  is the solution  $F_i$  of  $k$ .

So if you want in terms of  $r$  you have to write  $\mu$   $i$  so  $r$  is  $\mu$   $i$  is you can replace you can reduce  $k$  into  $r$ , okay is already in  $r$  so you have to replace  $\mu$   $i$  as  $\alpha$   $a$  bar so these are the solutions these are your non-zero solutions that implies  $F_i$  of  $r$  so they implies you have  $u_i$  of  $r$ ,  $t$  the solutions for  $i$  you have the solutions  $F_i$   $r$  into that is  $J_0$  of  $\alpha$   $a$  by  $r$  into  $r$  this is one solution into, now what is other solution that is  $G$  into  $G$  you have  $G$  of  $t$   $G$  call this  $G_i$  of  $t$  corresponds to for each  $i$  you call it  $G$  of  $t$   $G_i$  is satisfying the second differential equation here.

So the second differential equation is this so if you consider put comeback and put  $G$  double dash of  $t$  so  $\lambda$  is minus  $\mu$  square so you have a plus  $\mu$  square into so for each  $i$  so you have  $\mu$   $i$  square into  $c$  square  $G$  of  $t$  equal to 0. So you have  $G$  of  $t$  is  $c$  as you call this for each  $i$  you all this  $a_i \cos \mu$   $i$   $ct$  plus  $b_i \sin \mu$   $i$   $ct$ , okay  $i$  is running from 1, 2, 3 onwards. So because  $i$  for each is depending on see  $G$  of  $t$  I am denoting also  $G$  is depending on  $i$  so you have each  $i$ .

So  $G_i$  is actually this for each  $i$  is from 1, 2, 3 onwards. So you know what is your  $G_i$  of  $t$  and  $F_i$  of  $t$ , so go back and put it here so  $G_i$  of  $t$  is  $J_0$  of  $\alpha$   $I$  by  $R$  into  $r$  into  $A_i \cos \mu$   $i$   $ct$  plus  $b_i \sin \mu$   $i$   $ct$ . Actually  $\mu$   $i$  is  $\alpha$   $a$  by  $r$  so you can replace this if you want so  $\alpha$   $I$  by  $r$  you can replace so  $\alpha$   $i$  by  $R$   $\alpha$   $i$  by  $R$ . So implies so this is to for every  $i$  equal to 1, 2, 3 onwards so for each  $i$   $u$  of  $u_i$  of  $r$ ,  $t$  that is the product of this solution and this solution is satisfying this

two dimensional wave equation and the boundary conditions so far we have not used the initial conditions.

Handwritten mathematical derivation in a software window:

$$\Rightarrow u_i(r, t) = J_0\left(\frac{\alpha_i}{R} r\right) \cdot Q_i(t) = \underbrace{J_0\left(\frac{\alpha_i}{R} r\right)}_{\text{boundary condition}} \left( A_i \cos\left(\frac{\alpha_i}{R} ct\right) + B_i \sin\left(\frac{\alpha_i}{R} ct\right) \right), \quad i=1, 2, \dots$$

$$\text{Let } u(r, t) = \sum_{i=1}^{\infty} u_i(r, t) = \sum_{i=1}^{\infty} \left( A_i \cos\left(\frac{\alpha_i}{R} ct\right) + B_i \sin\left(\frac{\alpha_i}{R} ct\right) \right) J_0\left(\frac{\alpha_i}{R} r\right) \text{ be the general soln of}$$

wave equation with B.C's.

Handwritten mathematical derivation in a software window:

wave equation with B.C's.

I.C 1:  $u(r, 0) = f(r) \Rightarrow \sum_{i=1}^{\infty} A_i J_0\left(\frac{\alpha_i}{R} r\right) = f(r)$

where  $A_i = \frac{\int_0^R f(r) J_0\left(\frac{\alpha_i}{R} r\right) dr}{\int_0^R r J_0^2\left(\frac{\alpha_i}{R} r\right) dr}, \quad i=1, 2, 3, \dots \checkmark$

Now like earlier you make a superposition of this let  $u$  be the solution so  $u$  of  $r, t$  as a superposition of all this  $i$  is from 1 to infinity  $u_i$  of  $r, t$  that is sigma  $i$  is from 1 to infinity so you have a  $A_i \cos \alpha_i$  by  $R$   $ct$  plus  $B_i \sin \alpha_i$  by  $R$   $ct$  into this  $J_0$  of  $\alpha_i$  by  $R$  capital  $R$  into small  $R$  so this is what you have be the solution the general solution of solution of wave equation with boundary condition, okay.

So if you assume this anyone can show that is actually uniform (())(51:59) like earlier that I am not proving so if you apply now apply the initial condition initial condition 1 will give you u at r, 0 equal to f of r implies this will give me u at t equal to 0 cos t that is one sin t will be 0 so you have i is from 1 to infinity Ai into J0 of alpha i by R into r equal to fr. Now I can get my Ai by simply integrate with use the dot product that we defined earlier so you get Ai you simply integrate both sides like this so you integrate from 0 to capital R and you have a weight function here r f of r times J0 all these functions are real valid functions so bar does not matter J0 of alpha i by capital R into small r into dr divided by now you are simply integrating this side from multiplying r J0 of alpha i by R into r this you are multiplying itself that is what only survives in this infinite sum so you have a square dr.

So this is what you get where i is this for each i is from 1, 2, 3 onwards. So if you apply initial condition 1 I can get my Ai's like this in the general solution here so Ai is known which is this.

(Refer Slide Time: 53:28)

The image shows a handwritten derivation on a digital whiteboard. At the top, it says "Wave equation with B.C. 1." Below this, it defines the first initial condition:  $u(r, 0) = f(r) \Rightarrow \sum_{i=1}^{\infty} A_i J_0\left(\frac{\alpha_i r}{R}\right) = f(r)$ . It then shows the formula for  $A_i$  as  $A_i = \frac{\int_0^R r f(r) J_0\left(\frac{\alpha_i r}{R}\right) dr}{\int_0^R r J_0^2\left(\frac{\alpha_i r}{R}\right) dr}$ , with a note " $i=1, 2, 3, \dots$ ".

Next, it defines the second initial condition:  $u_t(r, 0) = g(r) \Rightarrow \sum_{i=1}^{\infty} \left(\frac{\alpha_i B_i C}{R}\right) J_0\left(\frac{\alpha_i r}{R}\right) = g(r)$ . It then shows the formula for  $B_i$  as  $B_i = \frac{R \int_0^R r g(r) J_0\left(\frac{\alpha_i r}{R}\right) dr}{C \alpha_i \int_0^R r J_0^2\left(\frac{\alpha_i r}{R}\right) dr}$ , with a note " $i=1, 2, \dots$ ".

Now apply the initial condition 2 so you have that is ut at r, 0 is g of r that is ut at r, 0 if you differentiate this this is cos becomes and this becomes sin. So this will go of by an input t equal to 0 after differentiation with respect to t.

So what survives is di alpha i cr so you can see what you get is i is from 1 to infinity alpha i Bi by R c, okay so this is what you get into cos, cos alpha a by R ct t is equal to 0 that is 1 into J0 of alpha i by R into r equal to gr. So again now from this if you apply one can see that Bi so Bi you

can get it as  $B_i \alpha_i B_i c$  by  $R$  this whole constant I can get it as using the dot product that is 0 to capital  $R$  and you have a weight function  $r g$  of  $r$  into this eigen function that is  $J_0$  of  $\alpha_i$  by  $R$  into  $r dr$  and left hand side is survives only integral  $r$  to  $R$   $r$  into  $J_0$  square of  $\alpha_i$  by capital  $R$  into small  $r dr$ , okay.

So this will determine you are what is you are  $B_i$  so this implies this is  $R$  by  $C$  into  $\alpha_i$  if you bring this  $R C$   $\alpha_i$  at other side this is what you get as  $B_i$ 's so I know what is my  $B_i A_i$  in this solution. So that's solves now this is the solution as a superposition of all the solutions in this approval form but satisfies wave equation now boundary condition and the initial conditions so this is the solution that we are looking for, okay.

So this is the solution that is required here. So this is how you solve a second order this is how you solve two dimensional wave equation on a circular domain in the form of symmetrical radially symmetric solutions that satisfies the boundary conditions so that means the vibrations no vibrations at the boundary and you have the initial data that is you providing as a vibration at time  $t$  equal to 0 you have the displacement of the disk displacement of the drum or the membrane is 0 is given (56:12) and its velocity is also given.

That means vibrations so displacement and velocity of the vibrations of the drum are given, okay. Displacement and velocity of the drum at initially at time  $t$  equal to 0 is given. So this is how you solve so the general solution (56:34) in a separable form that you can see as a linear superposition of functions of  $r$  and functions of  $t$ , okay. So these are radially symmetric separable form of solutions for the vibrations of a drum, okay so which is a which so that actually is the solution of two dimensional wave equation, okay.

So we will see this is how we solve the wave equations and in one dimension and two dimension wave equation so far so we can pick up any other domain and make you so our intention is not just to solve two dimension wave equation in other domains we will main purpose is to make use of the Bessel equation that we have derived in the ordinary differential equations earlier. So This is how we can solve this is just to demonstrate the solutions of two dimensional wave equation in similar domain like circular domain, okay as an application.

So in the next video we will see how to solve we will move on to heat equation, so again like for wave equation like in the wave equation we try to solve the heat equation in the infinite case

infinite spatial domain that is you consider an infinite rod infinite rod you give an initial condition that you because in the heat equation you have only time derivative is 1 you have to provide only one initial condition and you provide the initial data so with this initial data heat equation you trying to solve in the full domain and the you can also do the semi-infinite domain and then (( ))(58:08) finite domain that is you can think of finite rods. So we will just see that how the solutions of heat equation will be in the next few videos, thank you very much.
