Interpolation Part VIII (Divided Difference Interpolation with Examples)

Welcome to the lecture series on numerical methods. Currently we are discussing interpolation. In interpolation we have discussed like finite difference operators and like Newton's forward difference formula, backward difference formula and central difference formula. And in the last lecture we have cover up this Lagrange interpolation formula. So now we will discuss about Newton's divided difference formula.

So before going to Newton's divided difference interpolation first we will discuss about what is divided differences? So divided difference means if you will just have a set of data points like x_0, y_0, x_1, y_1 up to x_n, y_n here. Maybe it is uniformly spaced or non-uniformly spaced but we can use this divided differences here. So suppose these corresponding values of y in terms of x if we are just expressing here as y equals to f of x for x equals to x_0 to x_n here.

We can just express this divided difference for this function y equals to f of x as like f of x_0, x_1 for two consecutive points we can just write f of x_1 minus f of x_0 by x_1 minus x_0 . Similarly if we want to write for x_1, x_2 for two consecutive points since whatever this tabular points I have written it up here that is starting point is x_0 , next point is x_1 , corresponding these y values are associated values like y_0, y_1 .

So we can just write this first function as also y_1 minus y_0 by x_1 minus x_0 here. And for the second two points like x_1 and x_2 if I want to express in divided difference form I can just write f of x_2 minus f of x_1 by x_2 minus x_1 here which can be written as y_2 minus y_1 by x_2 minus x_1 here.

(Refer Slide Time: 02:49)

$(x_0, y_0) (x_1, y_1) \dots \dots \dots (x_n, y_n)$
 $y = f(x)$ for $x = x_0, \dots, x_n$.
 $f[x_0, x_1] = \frac{f(x_1) - f(x_0)}{x_1 - x_0} = \frac{y_1 - y_0}{x_1 - x_0}$
 $f[x_1, x_2] = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{y_2 - y_1}{x_2 - x_1}$

Obviously the question arises that if we are just writing these values of x_0 and x_1 here in argument form or in arguments then how we can just express f of x_0 here? So we can just write obviously f of x_0 equals to f of x_0 as this one and f of x_1 since all are independent points we can just write these arguments as functional values at that points.

And if we are just going up to the last of the interval here that is x_{n-1} to x_n here we can just write this divided difference of x_{n-1} to x_n as f of x_n minus f of x_{n-1} divided by x_n minus x_{n-1} . And this can be written as also y_n minus y_{n-1} divided by x_n minus x_{n-1} here.

(Refer Slide Time: 03:51)

$(x_0, y_0) (x_1, y_1) \dots \dots \dots (x_n, y_n)$
 $y = f(x)$ for $x = x_0, \dots, x_n$.
 $f[x_0, x_1] = \frac{f(x_1) - f(x_0)}{x_1 - x_0} = \frac{y_1 - y_0}{x_1 - x_0}$
 $f[x_1, x_2] = \frac{f(x_2) - f(x_1)}{x_2 - x_1} = \frac{y_2 - y_1}{x_2 - x_1}$
 $f[x_0] = f(x_0), f[x_1] = f(x_1)$.
 $f[x_{n-1}, x_n] = \frac{f(x_n) - f(x_{n-1})}{x_n - x_{n-1}} = \frac{y_n - y_{n-1}}{x_n - x_{n-1}}$

So these are all called first order divided difference here and if you just go for second order divided differences here then we can just express the second order divided difference especially if the points are placed at like x_0, y_0, x_1, y_1 up to x_n, y_n here. At a time if we are just considering three points suppose x_0, x_1 and x_2 we can just write this divided difference that in the form of second order divided differences. That as f of x_0, x_1, x_2 as f of x_1, x_2 minus f of x_0, x_1 divided by x_2 minus x_0 here.

(Refer Slide Time: 04:47)

The image shows a handwritten mathematical formula on a piece of paper. At the top, it lists three points: $(x_0, y_0), (x_1, y_1), \dots, (x_n, y_n)$. Below this, the text "Second order" is written and underlined. The main formula is $f[x_0, x_1, x_2] = \frac{f[x_1, x_2] - f[x_0, x_1]}{x_2 - x_0}$.

And the third order divided difference since if you will just see here for second order divided difference we are just considering three points. For the first order divided difference we are just considering two points there. So if we will just go for third order divided difference here then we have to consider like four points here x_0, x_1, x_2, x_3 and it can be written in the form of like f of x_1, x_2, x_3 minus f of x_0, x_1, x_2 divided by x_3 minus x_0 .

(Refer Slide Time: 05:27)

$(x_0, y_0), (x_1, y_1), \dots, (x_n, y_n)$.

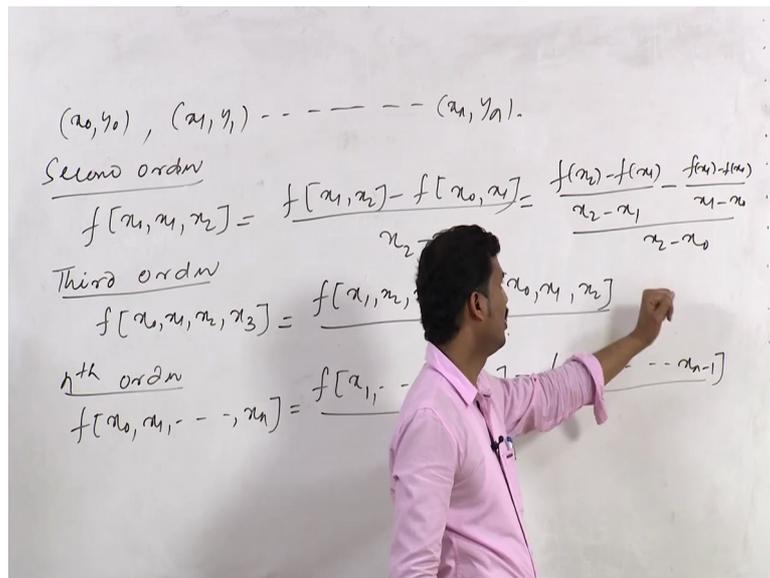

Second order
$$f[x_0, x_1, x_2] = \frac{f[x_1, x_2] - f[x_0, x_1]}{x_2 - x_0}$$

Third order
$$f[x_0, x_1, x_2, x_3] = \frac{f[x_1, x_2, x_3] - f[x_0, x_1, x_2]}{x_3 - x_0}$$

And for nth order divided difference we can just write that one as like nth order if you will have like n plus 1 values here, x_0, x_1 up to x_n here. We can just write this one as x_1 to x_n minus f of x_0 to x_{n-1} divided by x_n minus x_0 here. We can just see that if we are just going for this like first order divided difference we are just using two points and especially that can establish a relationship between these functional values at x_1 and x_0 .

And if we are just going for the second order divided difference here we can just find that this establishes a relationship between like if again if you just take this differences here it can be written in the form of f of x_2 minus f of x_1 divided by x_2 minus x_1 minus f of x_1 minus f of x_0 divided by x_1 minus x_0 divided by x_2 minus x_0 here. This means that this establishes a relationship between x_2, x_1 and x_1, x_0 .

(Refer Slide Time: 06:49)

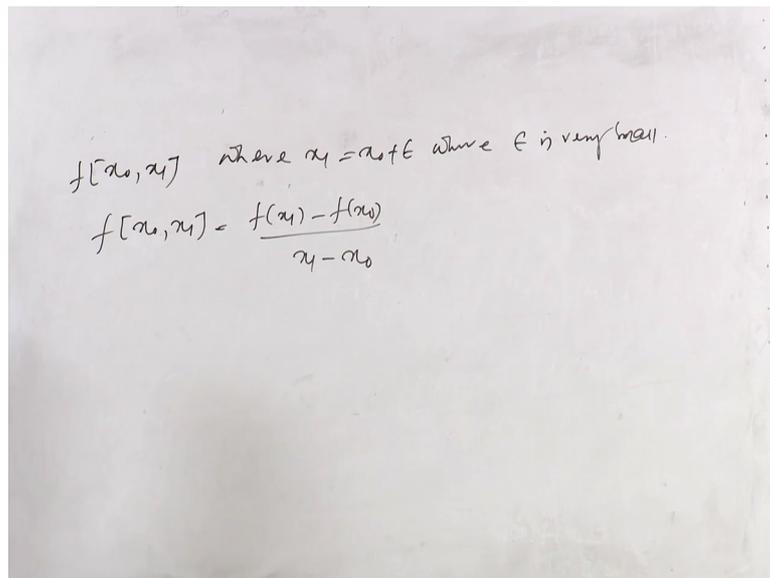

And if we just go for this third order divided difference here, it establishes a relationship between like x_0, x_1, x_2 and x_3 combinedly here. The advantage of this method is that in a Lagrange interpolation method usually whenever an extra point is added there so we have to do all the computations newly. This means that all of these products again we have to consider in a modified form that the extra point can be multiplied with the rest of the factors there.

But here if you will just see this extra point can be added in a uniform way that extra multiplication is not needed. If we are just seeing this differences here, these arguments are like equal if the divided differences may still have a meaning here. This means that if the arguments are equal like suppose x_0 if we want to write like f of $x_0 x_0$ there. This means that if we are just writing f of $x_0 x_1$ suppose where x_1 can be written as x_0 plus epsilon where epsilon is very small.

This means that we can just consider epsilon tends to 0 here. So then we can just express f of $x_0 x_1$ as f of x_1 minus f of x_0 divided by x_1 minus x_0 . Obviously this is the like first order this divided difference formula represents in this form here.

(Refer Slide Time: 08:28)

$f[x_0, x_1]$ where $x_1 = x_0 + \epsilon$ where ϵ is very small.

$$f[x_0, x_1] = \frac{f(x_1) - f(x_0)}{x_1 - x_0}$$

But if you will just replace this x_1 here in the form of x_0 plus epsilon where epsilon is very small we can just write this statement as in the form of limit epsilon tends to 0, f of x_0 plus epsilon minus f of x_0 divided by epsilon here. And obviously this is nothing but f' of x_0 here. So we can just say that here if the arguments are equal then the divided difference still produces some value here.

(Refer Slide Time: 09:03)

Divided difference are independent on the order of arguments

Similarly it can be show that

$$f[x_0, x_1, \dots, x_n] = \frac{f[x_0]}{(x_0 - x_1) \dots (x_0 - x_n)} + \frac{f[x_1]}{(x_1 - x_0) \dots (x_1 - x_n)} + \dots + \frac{f[x_n]}{(x_n - x_0) \dots (x_n - x_{n-1})}$$

Hence divided difference are symmetric in their arguments.

Now let the arguments be equally spaced, so that

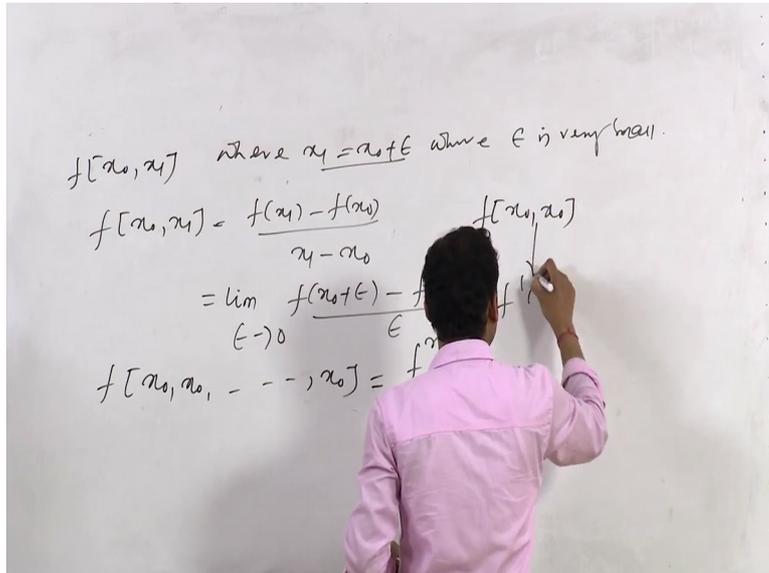

$$x_1 - x_0 = x_2 - x_1 = \dots = x_n - x_{n-1} = h$$

IST ROORKEE NPTEL ONLINE CERTIFICATION COURSE 5

And it is in the form like if we are just considering here f of x_0 where x_1 can be represented in the form of x_0 plus epsilon and epsilon is very small then it can just represent the derivative of this function at that point only. So if suppose f of x is a differentiable and if

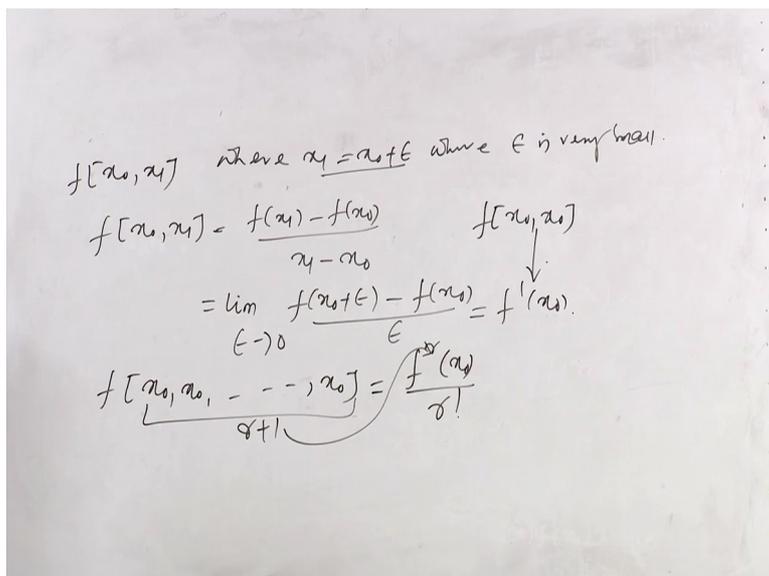

we will have this r plus 1 argument suppose. Like we can just write f of x 0 x 0 up to r plus 1 times. We can just write this one as f to the power r of x 0 by r factorial. Since if you will just see here two points are there, so that is why we are just writing this as f of x 0 x 0 as f dash x 0 here.

(Refer Slide Time: 09:52)

Similarly we can just consider that this should be r plus 1 points to get this derivative in the form order of r here.

(Refer Slide Time: 10:04)

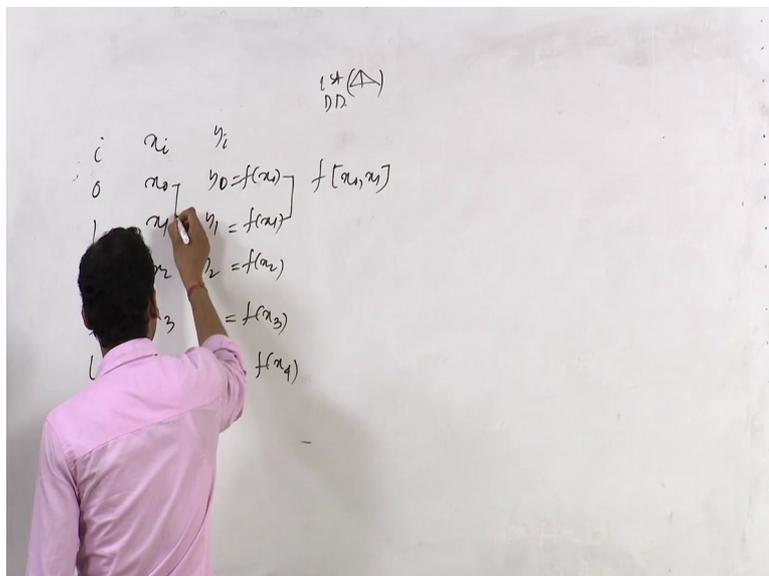

So if you will just go for this divided difference table here perfectly we can just find that this tabular values like i equals to 0, 1, 2, 3, 4 and its corresponding values suppose x_0, x_1, x_2, x_3, x_4 then we can just evaluate this first order divided difference, second order divided difference, third order divided difference to get any of the approximated value within that range.

This means that suppose like our earlier computation if the value is asked to compute within any of the interval suppose then we have to use this divided difference in such a fashion that this value can be computed in easy form. So that is why if you will just consider like i as the values as 0, 1, 2, 3, 4 here, the corresponding x_i values are x_0, x_1, x_2, x_3, x_4 here. And corresponding these y values we can just write y as y_0, y_1, y_2, y_3, y_4 here.

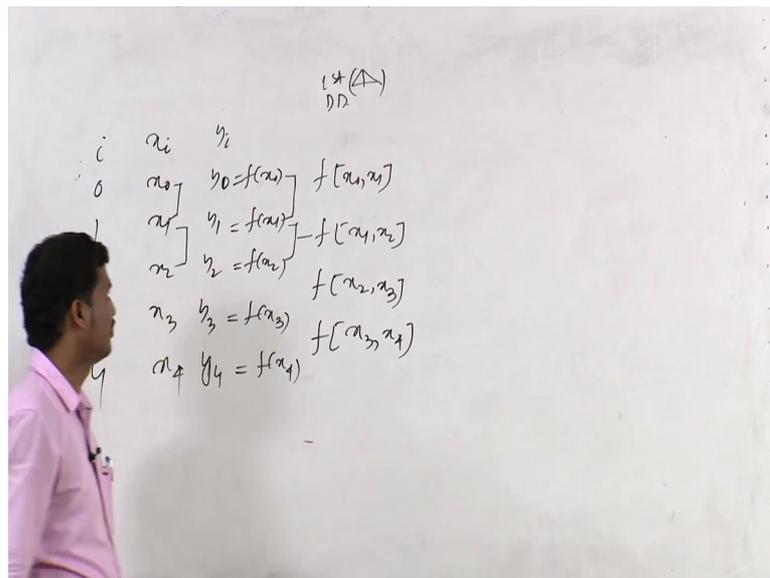

Or we can just write this one as f of x_0, f of x_1, f of x_2, f of x_3, f of x_4 . And if you will take this first order divided difference here sometimes also this divided difference is written in this form also. And the first order divided difference if you will just see that is just giving you f of $x_0 x_1$ here. This means that the difference of these two divided by the difference of these two here.

(Refer Slide Time: 11:47)

And if you will just take this divided difference of $x_1 x_2$ here, that will just give you f of x_2 minus f of x_1 divided by x_2 minus x_1 here. Similarly if you just consider this divided difference of like $x_2 x_3$ here then we can just consider that one as f of x_3 minus f of x_2 divided by x_3 minus x_2 . Similarly we can just find this divided difference of like $x_3 x_4$ as f of x_4 minus f of x_3 divided by x_4 minus x_3 .

(Refer Slide Time: 12:29)

And then second order divided difference you can just find it out here that is in the form of like f of x_0, x_1, x_2 . And then we can just write this one as f of x_1, x_2, x_3 here. And next divided difference we can just write x_2, x_3, x_4 here. Similarly the third order divided difference if you just see you can just write this one as f of x_0, x_1, x_2, x_3 and the third order divided difference for this function if you will just write, this can be started from x_1 to x_3, x_4 here.

And the last divided difference if we want to write this can be (re) represented as fourth divided difference which can be written as f of x_0, x_1, x_2, x_3, x_4 here.

(Refer Slide Time: 13:33)

Divided difference interpolation (Continue...)

Divided Difference Table

i	x_i	$f(x_i)$	1 st DD	2 nd DD	3 rd DD	4 th DD
0	x_0	$f(x_0)$	$f(x_0, x_1)$			
1	x_1	$f(x_1)$	$f(x_1, x_2)$	$f(x_0, x_1, x_2)$		
2	x_2	$f(x_2)$	$f(x_2, x_3)$	$f(x_1, x_2, x_3)$	$f(x_0, x_1, x_2, x_3)$	
3	x_3	$f(x_3)$	$f(x_3, x_4)$	$f(x_2, x_3, x_4)$	$f(x_1, x_2, x_3, x_4)$	$f(x_0, x_1, x_2, x_3, x_4)$
4	x_4	$f(x_4)$				

7

So if the tabular value is just given like x_i and y_i so we can just find this divided difference table and based on this divided difference table data we can just evaluate this polynomial at any point within this interval using any of the formula like Newton's divided difference formula or any specified formula which can be based on this divided differences. So next we can just show that this divided difference arguments are independent.

(Refer Slide Time: 13:58)

Divided difference are independent on the order of arguments

For example, in case of second divided difference
 $f(x_0, x_1, x_2) = f(x_0, x_2, x_1) = f(x_1, x_0, x_2) = f(x_2, x_0, x_1)$, etc.

We will prove the above statement by induction.

The first divided difference is given by,

$$f[x_0, x_1] = \frac{f[x_1] - f[x_0]}{x_1 - x_0} = \frac{f[x_0]}{x_0 - x_1} + \frac{f[x_1]}{x_1 - x_0}$$

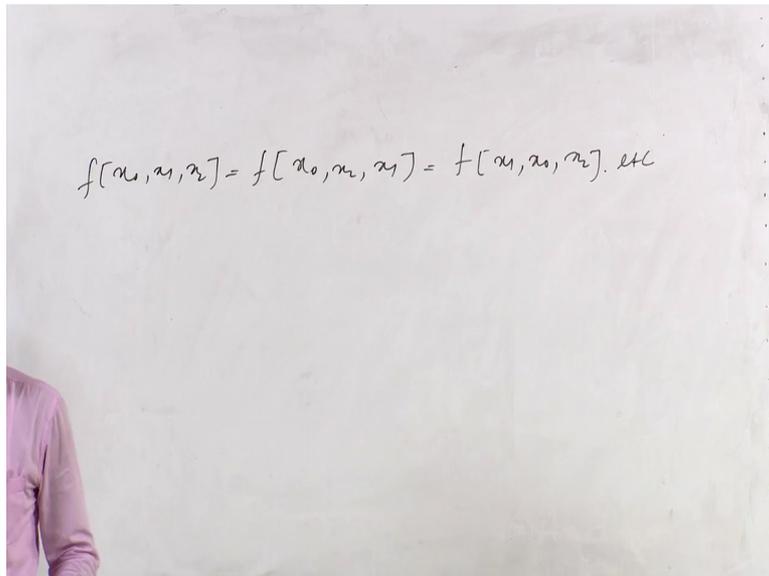

We see that if the arguments x_0 and x_1 are interchanged, the expression on the right side remain same.

16

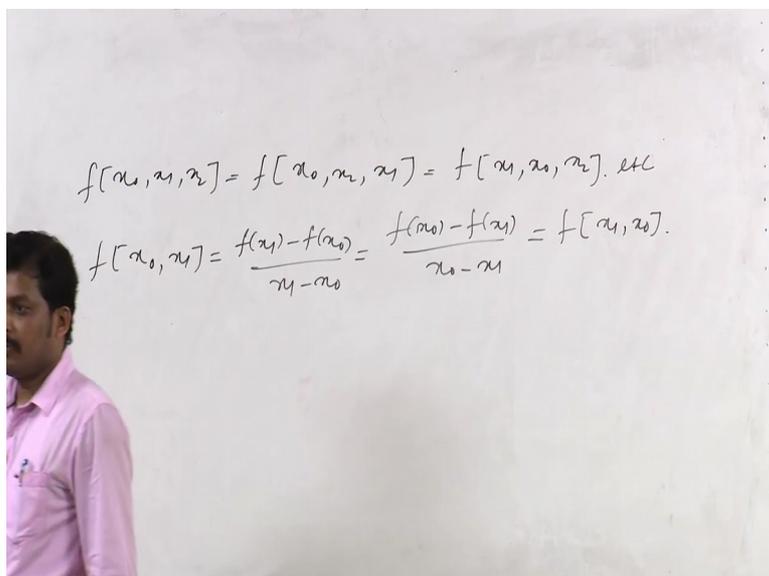

This means that if we are just considering these arguments here, the arguments can be written in the form of like suppose pre arguments if we are just writing or the second order arguments, these arguments can be written in the form of like x_0, x_1, x_2 here. This can be written also as f of x_0, x_2, x_1 . And this can also be written in the form of like f of x_1, x_0, x_2 .

(Refer Slide Time: 14:36)

$$f[x_1, x_2] = f[x_0, x_1] = f[x_2, x_0] \text{ etc}$$

So this can be proved easily since if you will just see for first order divided difference either we can just write $f[x_0, x_1]$, it can be written as $\frac{f(x_1) - f(x_0)}{x_1 - x_0}$ or it can be written as $\frac{f(x_0) - f(x_1)}{x_0 - x_1}$ here. This is nothing but $f[x_1, x_0]$ here.

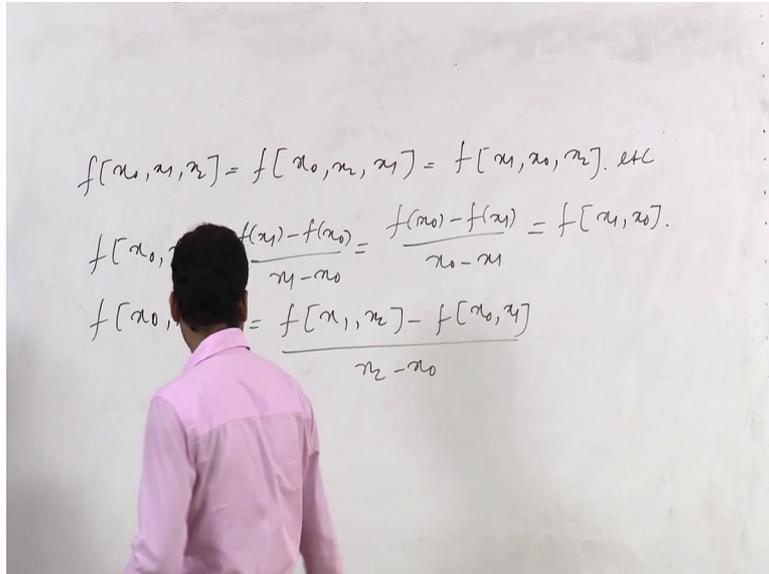

(Refer Slide Time: 15:01)

$$f[x_1, x_2] = f[x_0, x_1] = f[x_2, x_0] \text{ etc}$$
$$f[x_0, x_1] = \frac{f(x_1) - f(x_0)}{x_1 - x_0} = \frac{f(x_0) - f(x_1)}{x_0 - x_1} = f[x_1, x_0]$$

So similarly we can just show this independent order of arguments are like independent in like divided difference of order 2, order 3. We can just show that one also. So if you will just go for this like second order divided difference we can just find that $f[x_0, x_1, x_2]$, it

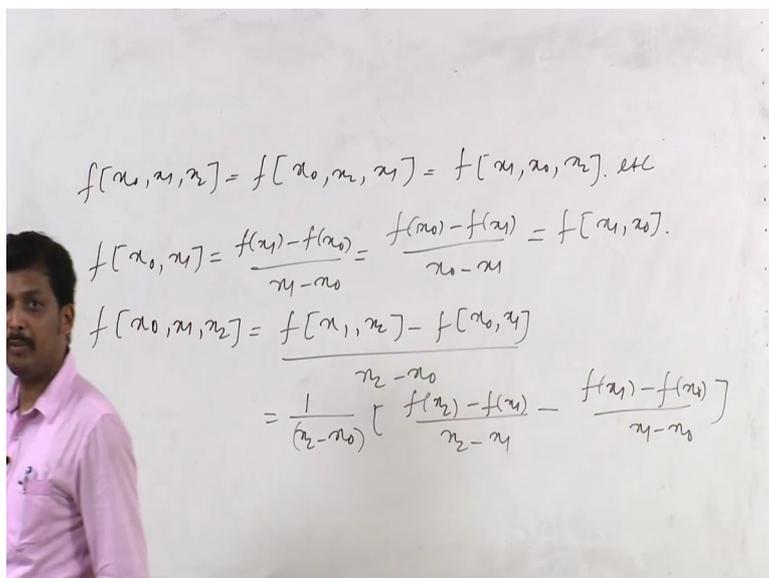

can be written in the form of like $f(x_1, x_2) - f(x_0, x_1)$ divided by $x_2 - x_0$ here.

(Refer Slide Time: 15:41)

And if I will just take here 1 by $x_2 - x_0$, then it can be written in the form of like $f(x_2) - f(x_1)$ divided by $x_2 - x_1$ minus $f(x_1) - f(x_0)$ divided by $x_1 - x_0$ here.

(Refer Slide Time: 16:04)

So if you all just take common of these terms here I can just show that 1 minus x_2 minus x_0 this can be written in the form of like $f(x_1) - f(x_2)$ by $x_1 - x_2$ minus $f(x_1) - f(x_0)$ by $x_1 - x_0$

minus f of x_1 by x_0 minus x_1 there. And obviously if you will just interchange the signs, we can just write this complete statement as in the form of here f of x_0 divided x_0 minus x_1 , x_0 minus x_2 plus f of x_1 divided by x_1 minus x_0 , x_1 minus x_2 plus f of x_2 divided by x_2 minus x_0 , x_2 minus x_1 here.

(Refer Slide Time: 17:05)

$$\begin{aligned}
 f[x_0, x_1, x_2] &= f[x_0, x_1, x_2] = f[x_1, x_0, x_2], \text{ etc} \\
 f[x_0, x_1] &= \frac{f(x_1) - f(x_0)}{x_1 - x_0} = \frac{f(x_0) - f(x_1)}{x_0 - x_1} = f[x_1, x_0] \\
 f[x_0, x_1, x_2] &= \frac{f[x_1, x_2] - f[x_0, x_1]}{x_2 - x_0} \\
 &= \frac{1}{(x_2 - x_0)} \left[\frac{f(x_2) - f(x_1)}{x_2 - x_1} - \frac{f(x_1) - f(x_0)}{x_1 - x_0} \right] \\
 &= \frac{f(x_2)}{(x_0 - x_1)(x_0 - x_2)} + \frac{f(x_1)}{(x_1 - x_0)(x_1 - x_2)} + \frac{f(x_0)}{(x_2 - x_0)(x_2 - x_1)}
 \end{aligned}$$

So again interchanging of arguments it does not affect the solution process also here. Similarly it can be shown that if we will just consider a n th ordered divided difference it can be written in the form of like f of x_0 x_1 to x_n suppose, n plus 1 terms are there.

So that is why we can just say that this is n th order divided difference and it can be written in the form of like f of x_0 divided by x_0 minus x_1 to x_0 minus x_n plus f of x_1 divided by x_1 minus x_0 , x_1 minus x_2 up to x_1 minus x_n plus f of x_n divided by x_n minus x_0 , x_n minus x_1 up to x_n minus x_{n-1} here.

(Refer Slide Time: 18:11)

$$f[x_0, \dots, x_n] = \frac{f(x_0)}{(x_0 - x_1) \dots (x_0 - x_n)} + \frac{f(x_1)}{(x_1 - x_0) \dots (x_1 - x_n)} + \dots + \frac{f(x_n)}{(x_n - x_0) \dots (x_n - x_{n-1})}$$

Hence we can just say that these divided differences are symmetric in their arguments. Now let the arguments be equally spaced suppose. Like $x_1 - x_0$ equals to $x_2 - x_1$. Suppose this space size is h here. If it is equally spaced we can just say that all of this differences like we can just express $x_1 - x_0$ as h here, so it can be expressed as h to the power n here. Similarly $f(x_1)$ by h to the power n , so likewise we can just express the total arguments here.

So if we want to express it in divided difference (form) formula suppose then we can just use this one in a form that as $f(x)$ equals to $f(x_0) + (x - x_0) f[x_0, x_1] + (x - x_0)(x - x_1) f[x_0, x_1, x_2] + \dots + (x - x_0) \dots (x - x_{n-1}) f[x_0, x_1, \dots, x_n]$.

(Refer Slide Time: 19:15)

Newton's Divided Difference Formula

If $x_0, x_1, x_2, x_3, \dots, x_n$ are given set of observations with $y_0, y_1, y_2, y_3, \dots, y_n$ are their corresponding values, where the function $y = f(x)$ is given, then the interpolating polynomial is:

$$f(x) = f[x_0] + (x - x_0)f[x_0, x_1] + (x - x_0)(x - x_1)f[x_0, x_1, x_2] + \dots + (x - x_0)(x - x_1)\dots(x - x_{n-1})f[x_0, x_1, \dots, x_n]$$

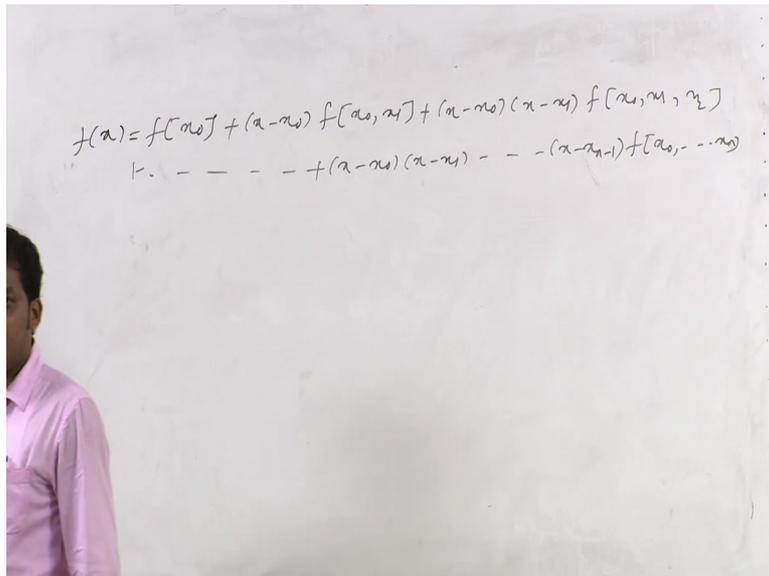

Or

$$f(x) = \sum_{i=0}^n \left\{ f[x_0, x_1, \dots, x_i] \prod_{j=0}^{i-1} (x - x_j) \right\}$$

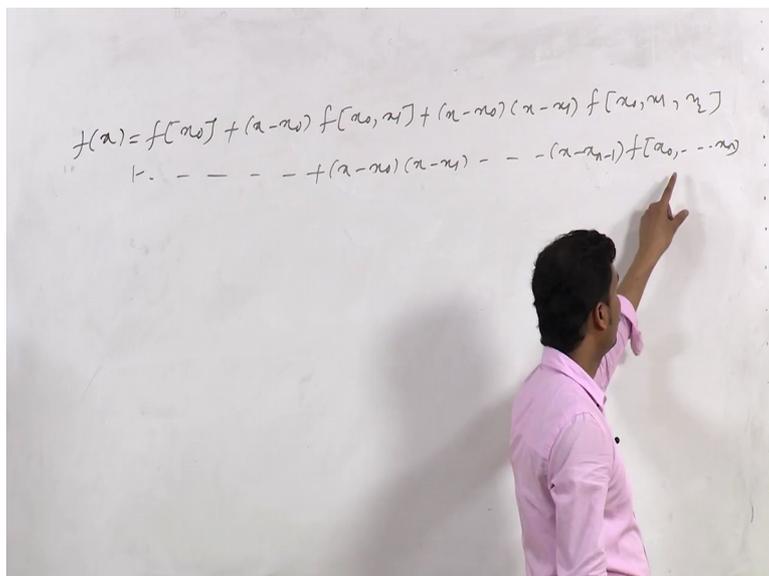

So if we want to prove this formula that Newton's divided difference interpolation formula here the statement is, if x_0, x_1, \dots, x_n are given set of observations for $y_0, y_1, y_2, \dots, y_n$ are there corresponding values where the function y equals to f of x is given then the interpolating polynomial is f of x equals to f of x_0 plus x minus x_0 , f of x_0, x_1 plus x minus x_0 , x minus x_1 , f of x_0, x_1, x_2 . So likewise we can just write this one as x minus x_0 , x minus x_1 to x minus x_{n-1} , f of x_0 to x_n here.

(Refer Slide Time: 20:14)

So especially this immediate next term it can be said to be as the remainder term where another x value it is required to get this last term there. Since if you will just see here for the remainder term or the next immediate term if you will just see this next another term here that is x minus x n here and it also requires another extra point to get this remainder term for the series to truncate over there.

(Refer Slide Time: 20:36)

So if you will just see it can be written in the product form also here that is f of x equals to i equals to 0 to n, f of x 0 x 1 to x i that can be written as also product of j equals to 0 to i minus 1, x minus x j. And if you just go for the proof of this divided difference formula here,

especially we can just write $f(x-x_0)$ this can be written in the form of like $f(x)$ minus $f(x_0)$ divided by $x-x_0$. Either way you can just write that one since this order of arguments are independent or symmetrical in nature.

So from these two if you want to separate we can just write $f(x)$ equals to $f(x_0)$ plus $x-x_0$ times $f(x)$ minus $f(x_0)$ here. Similarly if you will just write or if you will just add extra more point here like x, x_0, x_1 here we can just write this one as $f(x_0, x_1)$ or we can just write as $f(x, x_0)$ here minus $f(x_0, x_1)$ since we are just saying that this is independent of order of arguments we can write in any forms here, so $f(x_0, x_1)$ here divided by $x-x_1$.

(Refer Slide Time: 22:07)

The image shows a whiteboard with handwritten mathematical formulas. The top line is the Taylor expansion of a function $f(x)$ around a point x_0 up to the second order:

$$f(x) = f(x_0) + (x-x_0)f'(x_0) + \frac{(x-x_0)^2}{2}f''(\xi)$$
 where ξ is between x_0 and x . The second line shows the definition of the first-order mean value theorem:

$$f(x) - f(x_0) = \frac{f(x) - f(x_0)}{x - x_0} (x - x_0) = f'(\eta) (x - x_0)$$
 where η is between x_0 and x . The third line shows the definition of the second-order mean value theorem:

$$f(x, x_0, x_1) = \frac{f(x, x_0) - f(x_0, x_1)}{x - x_1}$$
 where x_1 is another point between x_0 and x .

And if we just separate this $f(x-x_0)$ here this can be written in the form of $f(x_0, x_1)$ plus $x-x_0$ times $f(x)$ minus $f(x_0, x_1)$ here. So if you just replace this function like $f(x-x_0)$ in this expansion here then we can just obtain this expression of $f(x)$ as $f(x)$ equals to $f(x_0, x_1)$ plus $x-x_0$ times $f(x)$ minus $f(x_0, x_1)$ here.

(Refer Slide Time: 22:59)

$$\begin{aligned}
 f(x) &= f[x_0] + (x-x_0)f[x_0, x_1] + (x-x_0)(x-x_1)f[x_0, x_1, x_2] \\
 &\quad + \dots + (x-x_0)(x-x_1)\dots(x-x_{n-1})f[x_0, \dots, x_n] \\
 f[x_0, x_1] &= \frac{f(x_1) - f(x_0)}{x_1 - x_0} \Rightarrow f(x) = f(x_0) + (x-x_0)f[x_0, x_1] \\
 f[x_0, x_1, x_2] &= \frac{f[x_0, x_1] - f[x_0, x_2]}{x_1 - x_2} \\
 f[x_0, x_1] &= f[x_0, x_2] + (x-x_2)f[x_0, x_1, x_2] \\
 f(x) &= f(x_0) + (x-x_0)f[x_0, x_1] + (x-x_0)(x-x_1)f[x_0, x_1, x_2]
 \end{aligned}$$

So likewise if you will just add one more point, finally we can just obtain this formula that can be given as $f(x)$ as $f(x_0)$ plus $(x-x_0)f[x_0, x_1]$ plus $(x-x_0)(x-x_1)f[x_0, x_1, x_2]$ plus up to $(x-x_0)(x-x_1)\dots(x-x_{n-1})f[x_0, x_1, \dots, x_n]$ plus $R(x)$ term or this complete expansion I can just write here that one as $R(x)$ term here.

(Refer Slide Time: 23:34)

Divided Difference Interpolation (continue...)

Putting the value of $f[x_0, x_1]$ from (4) in (3), we get

$$f(x) = f(x_0) + (x-x_0)f[x_0, x_1] + (x-x_0)(x-x_1)f[x_0, x_1, x_2] + \frac{(x-x_0)(x-x_1)(x-x_2)}{(x-x_0)(x-x_1)(x-x_2)}f[x_0, x_1, x_2] \quad (5)$$

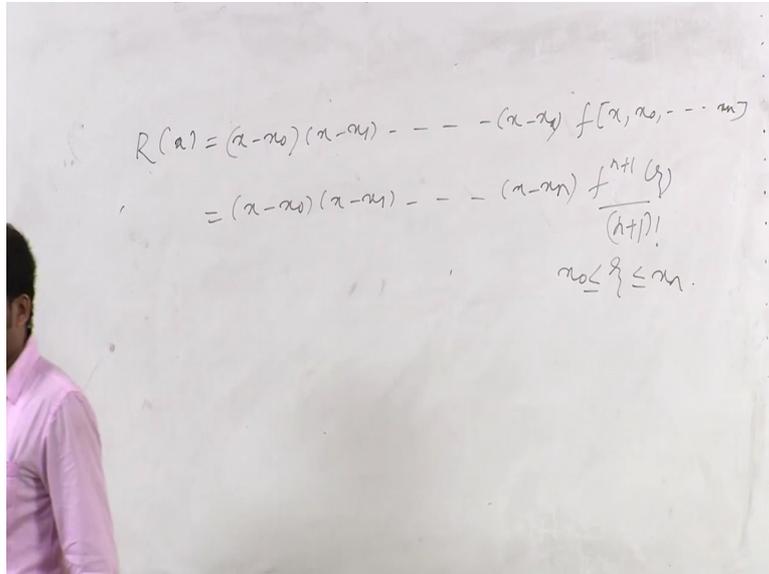

Proceeding in this manner. We get:

$$\begin{aligned}
 f(x) &= f(x_0) + (x-x_0)f[x_0, x_1] + (x-x_0)(x-x_1)f[x_0, x_1, x_2] \\
 &\quad + (x-x_0)(x-x_1)(x-x_2)f[x_0, x_1, x_2, x_3] \\
 &\quad + (x-x_0)(x-x_1)(x-x_2)(x-x_3)f[x_0, x_1, x_2, x_3, x_4] + \dots \dots \dots \\
 &\quad + (x-x_0)(x-x_1)\dots(x-x_{n-2})(x-x_{n-1})f[x_0, x_1, \dots, x_{n-1}, x_n] \\
 &\quad + R(x)
 \end{aligned}$$

So if I will just write this $R(x)$ term so like our earlier error term expansion I can just write this error term as $R(x)$ here as $(x-x_0)(x-x_1)\dots(x-x_n)$ and last term can be written as $(x-x_0)\dots(x-x_n)$ here. And obviously in a modified form it can be written as $(x-x_0)\dots(x-x_n)$

0, x minus x 1 to x minus x n, f to the power n plus 1 zeta by n plus 1 factorial here where zeta should be lies between x 0 to x n here.

(Refer Slide Time: 24:28)

So Newton's divided difference formula also converts to Newton's forward difference formula for equidistance tabular points. So based on this interpolation formula we will just solve 1 problem that is using this like tabular values that has been given as x as minus 1, 0, 3, 6, 7 and f of x is given as 3 , minus 6, 39, 822, 1611 here.

(Refer Slide Time: 24:56)

Divided Difference Interpolation (continue...)

Example: Using the following table find $f(x)$ as a polynomial in x ,

x	-1	0	3	6	7
$f(x)$	3	-6	39	822	1611

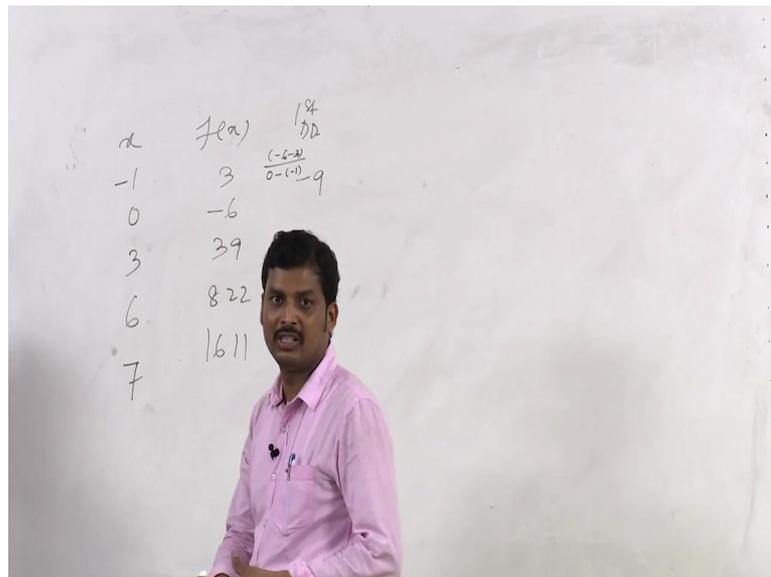

Divided Difference Table

x	$f(x)$	1 st DD	2 nd DD	3 rd DD	4 th DD
-1	3	-9	6	5	1
0	-6	15	41	13	
3	39	261	132		
6	822	789			
7	1611

If you will just use this divided difference that as like the tabular values as x and f of x that as minus 1, 0, 3, then 6, 7 and the f of x values are like 3, minus 6, 39, 822, 1611. So if you just find the first divided difference here this means that minus 6, minus 3 by 0 minus of minus 1 here. So it can just give the value of minus 9 here. Since minus 6 minus 3 if I will just write here minus 6 minus 3 divided by like 0 minus of minus 1 here. So that is nothing but minus 9.

(Refer Slide Time: 25:50)

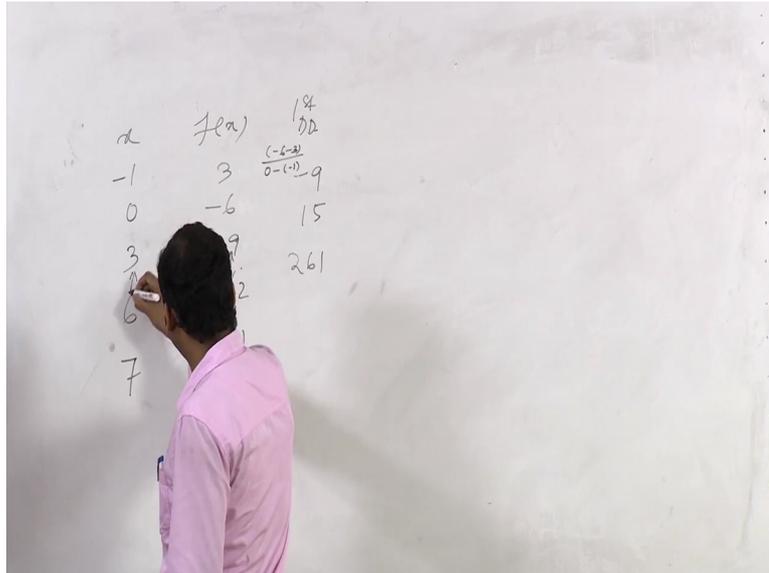

x	$f(x)$	$\frac{1}{x}$	$\frac{1}{x^2}$
-1	3		
0	-6		
3	39		
6	822		
7	1611		

$\frac{(-6-3)}{0-(-1)} = -9$

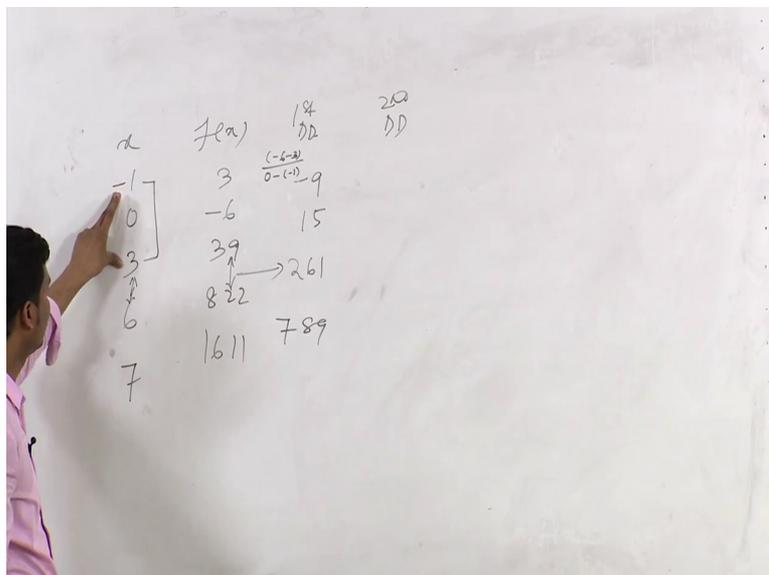

Similarly I can just find the difference like 39, minus of minus 6 by 3 minus 0 here and that will just give you value of 15 here. And if you will just take this next difference here I can just get that one as 261 here. This means that difference between these two here divided by difference of these two here.

(Refer Slide Time: 26:12)

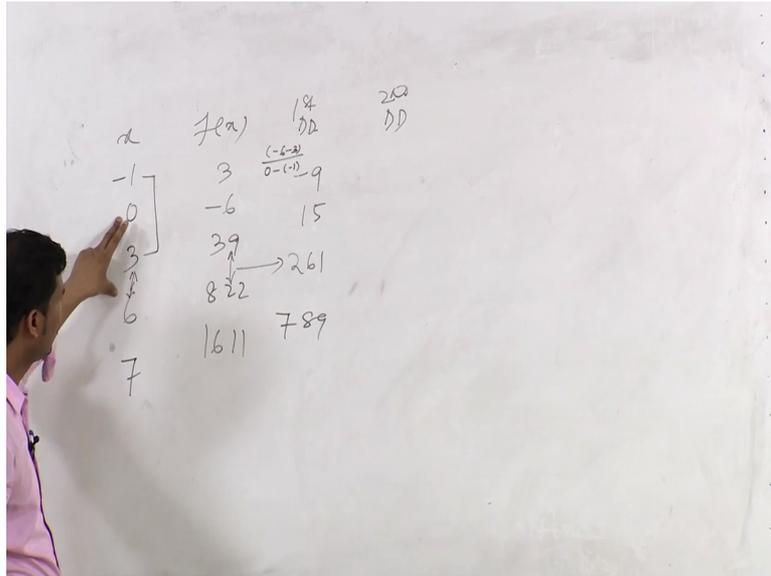

Similarly if you all just take the difference of 1611 minus 822 divided by 7 minus 6 here, I can just obtain this value as 789 here. Next we will just go for second order divided difference here that is 15 minus of minus 9 divided by 3 minus of minus 1 here. So for this one we have to consider like 3 minus of minus 1 here.

(Refer Slide Time: 26:43)

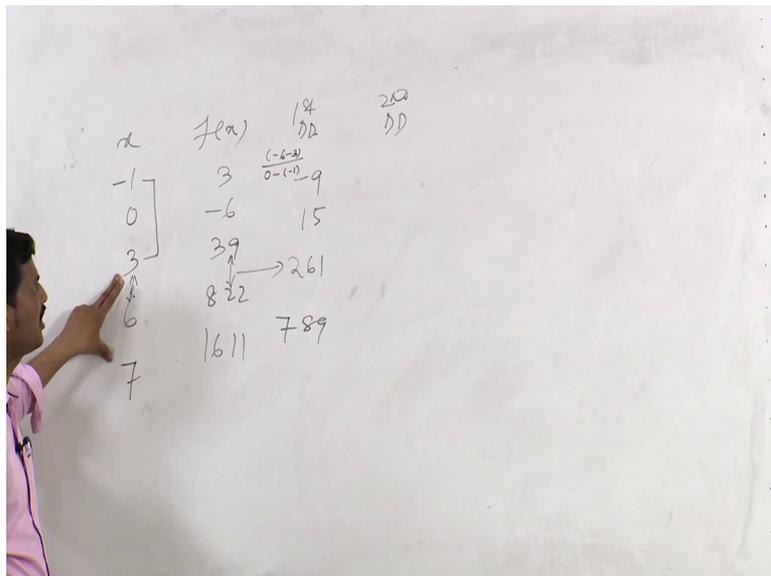

Second if I will just consider this divided difference of these two here, 261 minus 15 here, I have to consider the difference of 6 minus 0 here.

(Refer Slide Time: 26:53)

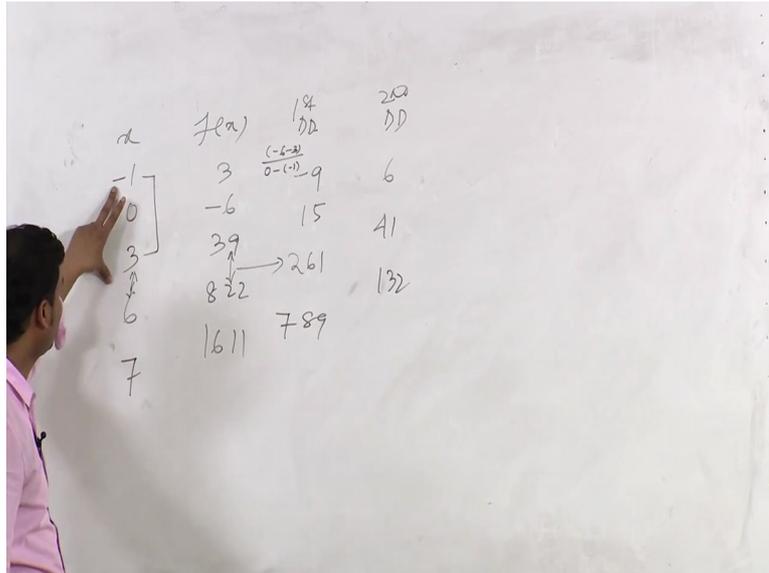

So the next one if I will just consider the difference of (se) 789 minus 261 here, I will just consider the difference of 7 minus 3 here.

(Refer Slide Time: 27:00)

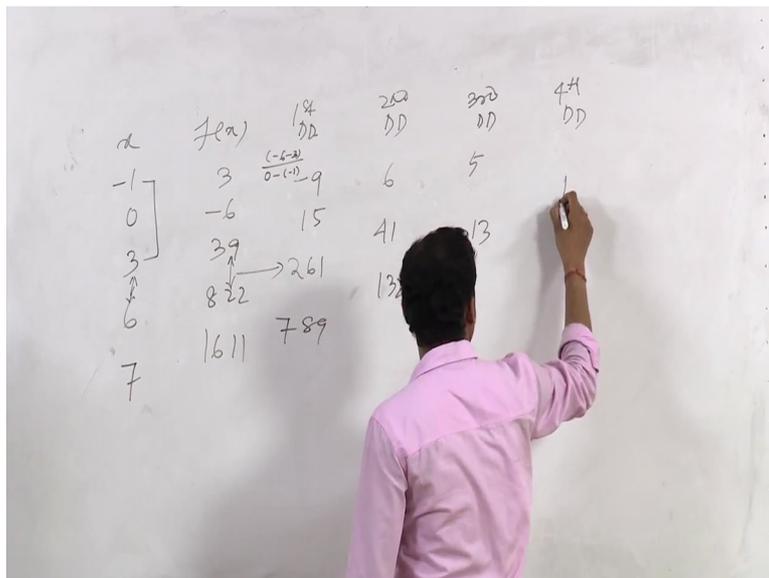

So this divided difference is (())(27:03) the values like 6 here, then 41, then 132 here. And again if I will just take the difference 41 minus 6 here, I have to take the difference of 6 minus of minus 1 here.

(Refer Slide Time: 27:15)

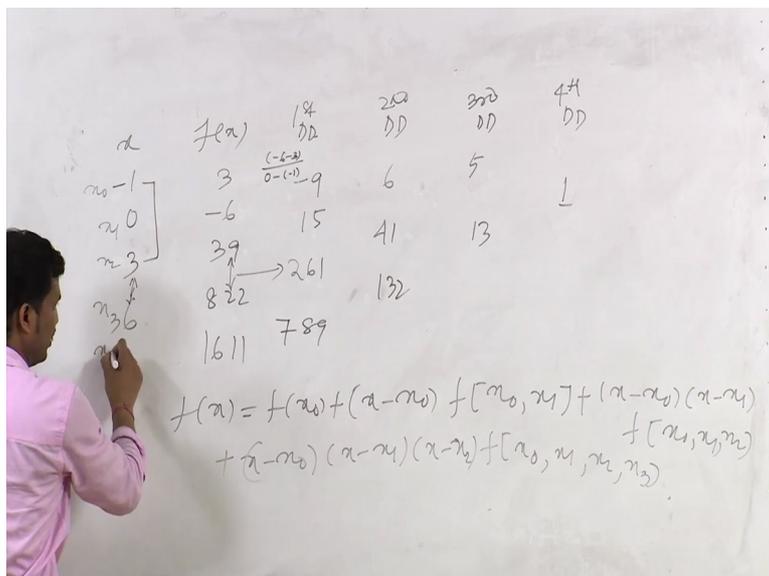

And if I will just take the difference of 132 minus 41 here, I will just take the difference of 7 minus 0 here. So these values are like 5 and 13 here. This is third order divided difference and fourth order divided difference that is 13 minus 5, 7 minus of minus 1 here. That is nothing but the value as 1 here.

(Refer Slide Time: 27:37)

So if you will just put in the formula we can just obtained that one as f of x equals to first value as f of x_0 plus x minus x_0 , f of x_0 x_1 plus x minus x_0 , x minus x_1 , f of x_0 , x_1 , x_2 plus x minus x_0 , x minus x_1 , x minus x_2 , f of x_0 , x_1 , x_2 , x_3 values. So if you all just put all these values then it can just provide us like one more point I have to add it out here. Since x_0 value is this one here, x_1 , x_2 , x_3 , x_4 here.

(Refer Slide Time: 28:34)

So I have to add one more term here that is x minus x_0 , x minus x_1 , x minus x_2 , x minus x_3 , f of x_0 , x_1 , x_2 , x_3 , x_4 here.

(Refer Slide Time: 28:54)

x	$f(x)$	1 st DD	2 nd DD	3 rd DD	4 th DD
$x_0 = -1$	3	$\frac{(-6-3)}{0-(-1)} = 9$	6	5	1
$x_1 = 0$	-6	15	41	13	
$x_2 = 3$	39	$\rightarrow 261$	132		
$x_3 = 6$	822				
$x_4 = 7$	1611	789			

$$\begin{aligned}
 f(x) = & f(x_0) + (x-x_0) f[x_0, x_1] + (x-x_0)(x-x_1) f[x_0, x_1, x_2] \\
 & + (x-x_0)(x-x_1)(x-x_2) f[x_0, x_1, x_2, x_3] \\
 & + (x-x_0)(x-x_1)(x-x_2)(x-x_3) f[x_0, x_1, x_2, x_3, x_4]
 \end{aligned}$$

So if you all just put all these values then I can just obtain this polynomial of order 4 here and the final polynomial as x to the power 4 minus 3 x cube plus 5 x square minus 6 here. So if I will just use this divided difference I can just deal any type of like interpolation formula to get this solutions. So next class maybe I will just continue for this some advanced interpolation formula. So that I will just discuss in the next lecture, thank you for listen this lecture.
